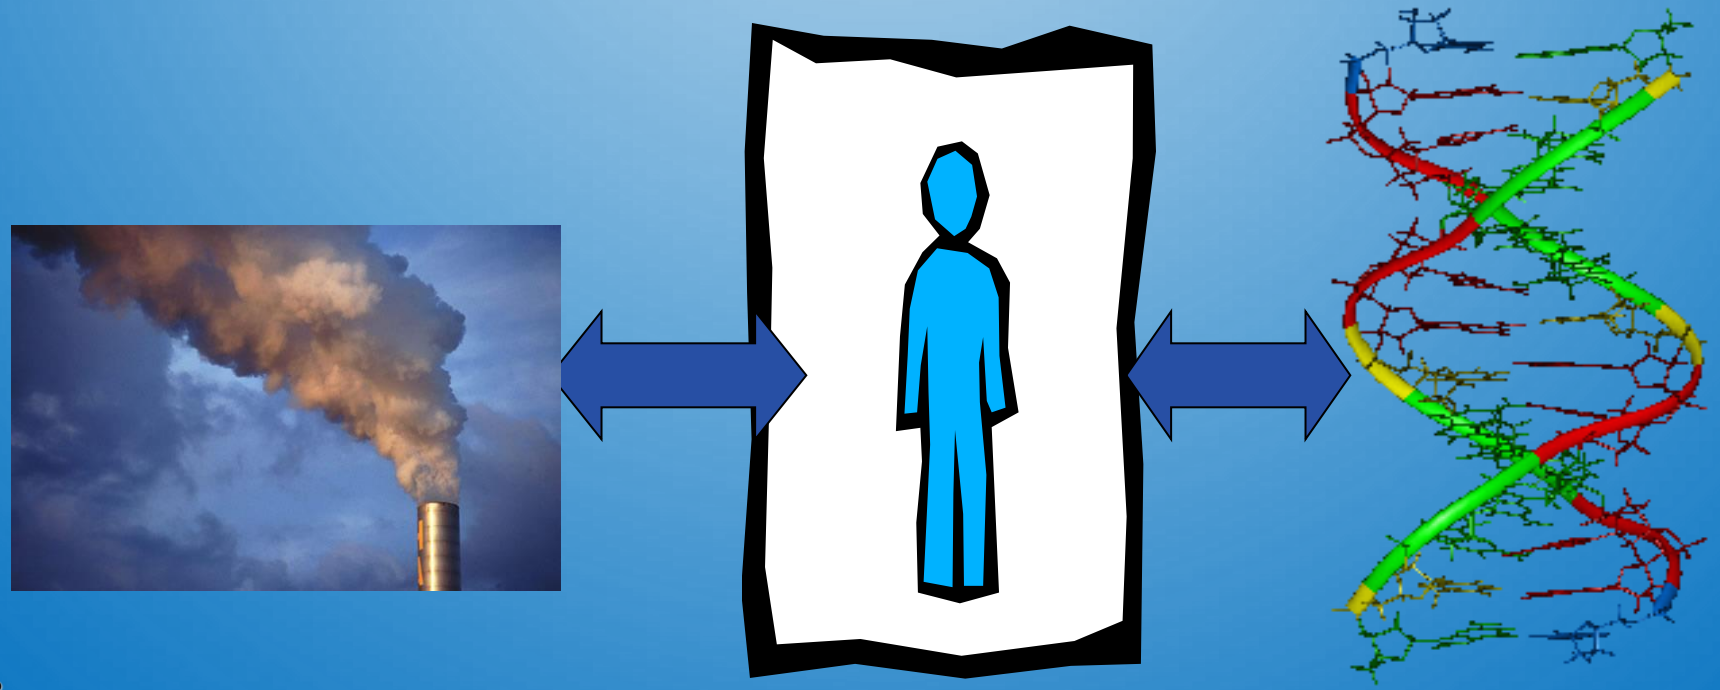
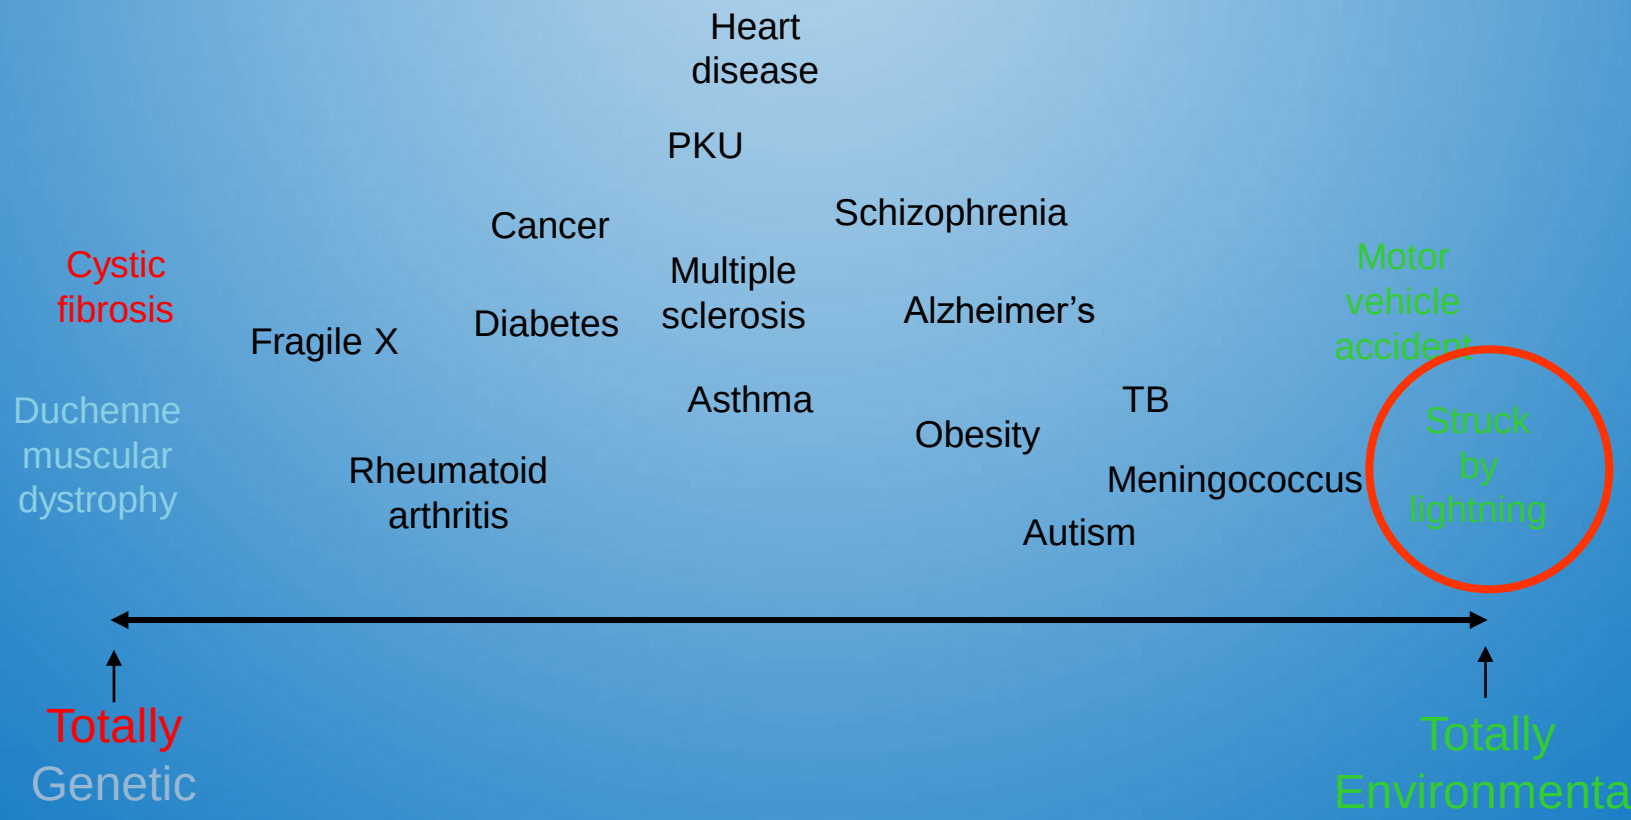
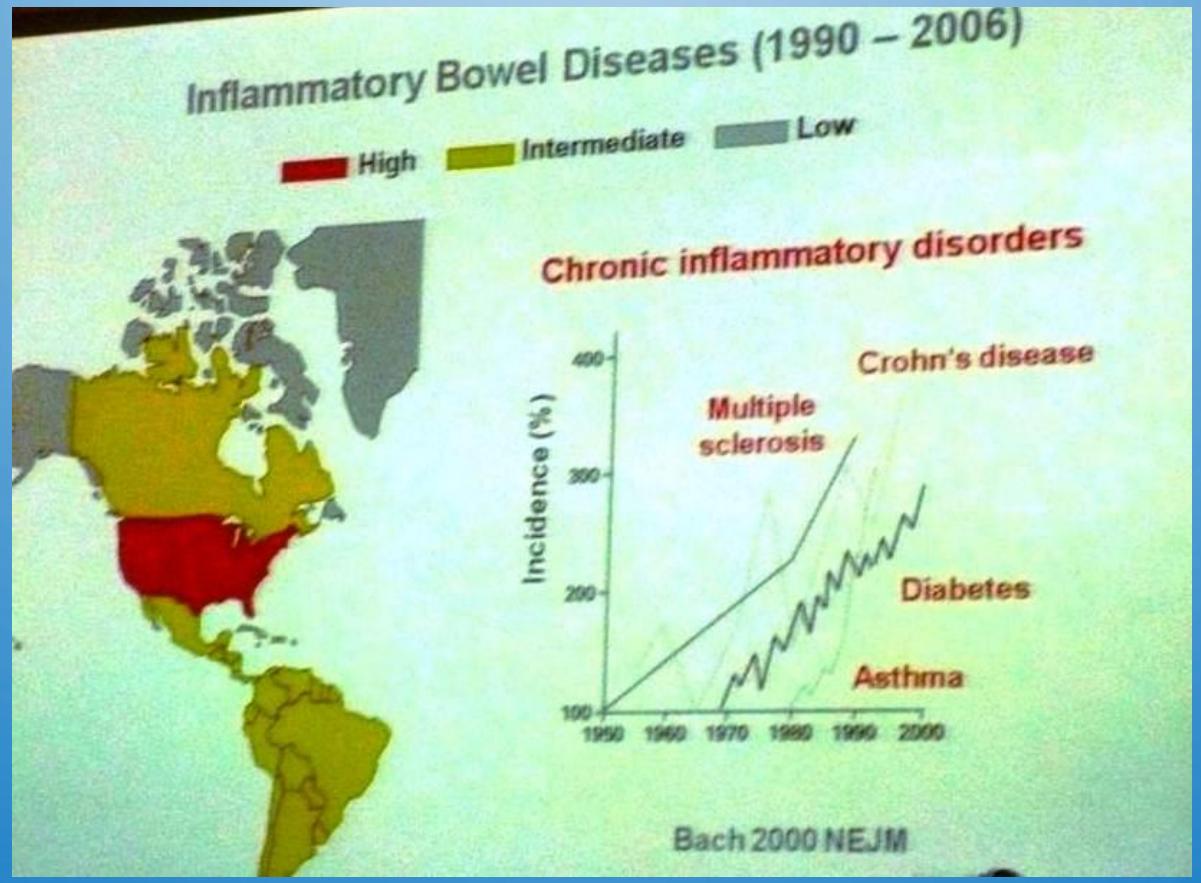
HUMAN: FROM INSIDE OR OUTSIDE HEALTH?



COMPLEX DISEASES: GEN-ENVIRONMENT



COMPLEX DISEASES INCREASE FAST, WHAT CHANGES IN THE ENVIRONMENT ?

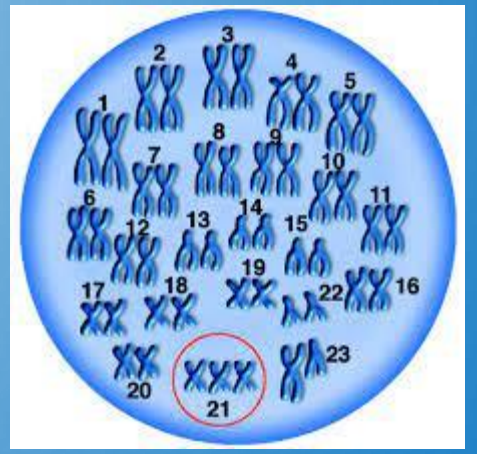


GENETICS

- Human genetics- scientific study of human variation and Heredity
- Medical genetics - study of the hereditary nature of human disease
- Clinical genetics- Care, diagnosis and counseling of patients with congenital malformations or genetic diseases

MUTATIONS

- Deletions- ranging from 1 bp to mega base
- Insertions- including duplications
- Single base substitution-
- Missense mutations, replace one amino acid with another in the gene product
- Nonsense mutations replace one amino acid codon with a stop codon
- Splice site mutations create or destroy signals for exon/intron splicing
- Frame shifts came be produced by deletions, insertions or splice mutations



MUTATION- FUNCTIONAL CHANGE

- Loss of function mutations
- Gain of function mutations

Single nucleotide polymorphisms (SNPs) are common DNA sequence variations among individuals.

A **tag SNP** is a representative single nucleotide polymorphism (SNP) in a region of the genome with high linkage disequilibrium (the non-random association of alleles at two or more loci)

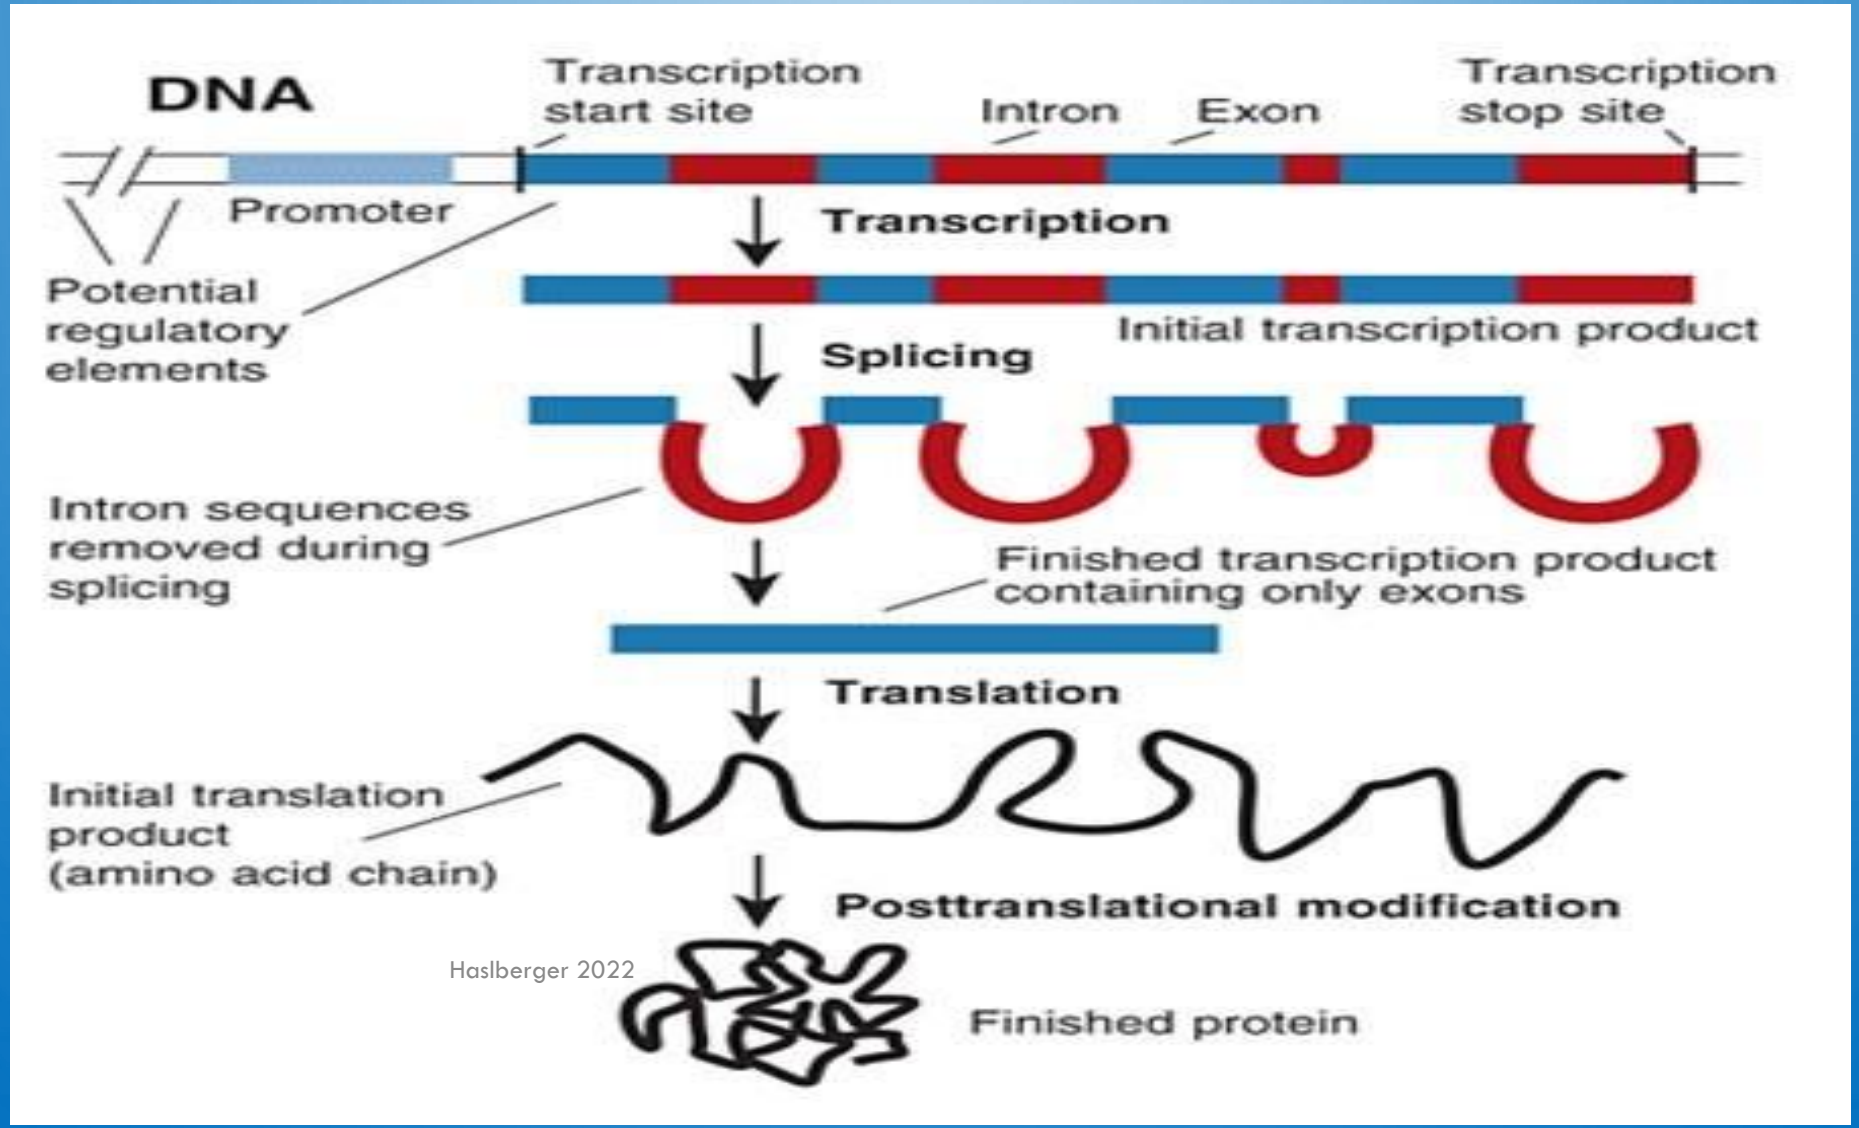
GENES STRUCTURE AND PROTEIN SYNTHESIS



INTRODUCTION TO HGP

- The **Human Genome Project (HGP)** was an international scientific research project that aimed to determine the **complete sequence of nucleotide base pairs** that make up human DNA and all the genes it contains.
- It remains the world's largest collaborative biological project.
- The idea was picked up in 1984 by the **US government** when the planning started, the project was formally launched in **1990** and was declared complete in **2003**.

INTRODUCTION TO HGP

- The Human Genome Project originally aimed to map the nucleotides contained in a **human haploid reference genome.**
- The "genome" of any given individual is unique; mapping the "human genome" involved **sequencing** the genomes of a small number of individuals and then **assembling** these together to get a complete sequence for each chromosome.
- The finished human genome is thus a **mosaic**, not representing any one individual.

GOALS OF HGP

- To identify and map all the **20,000-25,000 genes** (approx) in the human DNA from a physical and functional standpoint.
- To determine the sequences of the **3 billion chemical base pairs** that make up the human DNA.
- To store these informations in **databases.**
- To discover more **efficient technologies** for data analysis.
- Allow the private sector **access to the informations** and technologies that arise from this project.
- Also to **sequence the genomes of other organisms** that are important in medical research such as mouse, Drosophila etc,.
- To address ethical, legal and social issues.

PIONEERS IN HGP

- **Robert Sinsheimer** proposed the idea of sequencing the human genome in the year 1985.
- **Charles DeLisi** and **David Smith** proposed the budget for Human Genome Project.
- HGP act was passed in the US congress under **President Regan** in 1988.
- **James Watson** headed the NIH Genome Program.
- **Francis Collins** succeeded James Watson in 1993 as the overall Project Head and the Director of the NIH (which later become the National Human Genome Research Institute **NHGRI**) and was in power until the completion of HGP in 2003.

TIMELINE OF HGP

- **1970** – FREDRICK SANGER DEVELOPED A TECHNIQUE FOR DNA SEQUENCING, KNOWN AS THE SANGER'S METHOD OF DNA SEQUENCING.
- **1985** - ROBERT SINSHEIMER AT UCSC PROPOSED THE IDEA OF SEQUENCING THE HUMAN GENOME.
- **1986** -THE U.S. DEPT OF ENERGY AND THE NATIONAL INSTITUTE OF HEALTH CAME FORWARD TO FUND THE HUMAN GENOME PROJECT.

1989 - U.K's medical research council (MRC) joined the Human Genome Project.

TIMELINE OF HGP

1990 – HGP was officially launched with James Watson as its Project Director.
the 1st gene to be mapped was BRCA1, which is the gene for breast cancer.

1993 - 1st 5 year plan for HGP was published.
Sanger Institute(UK) joins HGP.

1994 – HGP's Human genetic mapping goal was achieved.

1995 - Genetic privacy act was passed.
1st bacterial genome was sequenced (Hemophilus influenzae)

1996 – 1st Human Gene map was published.
Yeast genome was sequenced.
HGP's mouse genetic mapping goal was achieved.

TIMELINE OF HGP

1997 - NIH becomes NHGRI.
E.coli genome sequenced.
Genoscope, French National Genome Sequencing Centre was established.

1998 - 2nd 5 year plan for HGP was published.
Japan's RIKEN Genomic Services Centre was established.
Genome of the roundworm Caenorhabditis elegans was sequenced.
SNP sequencing was initiated.
the Chinese National Human Genome Centres were established in Beijing and Shanghai.

1999 - sequencing of human chromosome 22 was completed and was published in "The Nature."

TIMELINE OF HGP

2000 - working draft of human genome completed.
US president Clinton & UK's PM Blair
support free access to genome information.
Genomes of D.melanogaster and A.thaliana
were sequenced & published in "The Nature".

2001 – working draft of human genome sequence was
published in "The Nature" & "Science".

2002 – working draft of mouse genome sequence was
completed & published.

2003 - finished version of human genome sequence
was completed.
HGP ended with all the goals achieved.

TECHNICAL ASPECTS IN HGP

- The process of determining the human genome first involves **genome mapping**, or characterizing the chromosomes. This is called a **genetic map.**
- The next step is **DNA sequencing** ,or determining the order of DNA bases on a chromosome. These are **physical maps.**

MAPPING STRATEGIES

- **Genetic markers** are invaluable for genome mapping.
- Markers are any inherited physical or molecular characteristics that are different among individuals of a population (polymorphic)
- A **genetic map** shows the relative locations of these specific markers on the chromosomes.
- An example of a marker includes restriction fragment length polymorphisms **(RFLP).**
- Used in RFLP markers are restriction enzymes. These enzymes recognize short sequences of DNA and cut them at specific sites, therefore, DNA can be cut into many different fragments. These fragments are the DNA pieces used in physical maps
- RFLPs reflect sequence differences in DNA sites which are cleaved by restriction enzymes.

20 Ea 21,22 22a,b J 30 23 23a 24 K 25 26 27 28 L

OUTCOMES OF HGP

- There are approximately **22,300** protein-coding genes in human beings, the same range as in other mammals. Mouse – 23,000 genes (approx)
- **Drosophila – 17,000 genes (approx),**
  C.elegans - < 22,000 genes
- we share many homologous genes (called "orthologs") with both these animals. But:-
- many of our protein-encoding genes produce more than one protein product (e.g., by alternative splicing of the primary transcript of the gene). On average, each of our ORFs produces 2 to 3 different proteins.
- So the human "proteome" (our total number of proteins) may be 10 or more times larger than that of the fruit fly and roundworm.

- A larger proportion of our genome :-
  encodes transcription factors
  is dedicated to control elements (e.g., enhancers) to which these transcription factors bind
  The combinatorial use of these elements provides much greater flexibility of gene expression than is found in Drosophila and C.elegans.

OUTCOMES OF HGP

- **Gene density :-**
  - 23 genes per million base pairs on chromosome 19
  - 5 genes per million base pairs on chromosome 13.
- Humans, and presumably most vertebrates, have genes not found in invertebrate animals like Drosophila and C. elegans. Few of those genes are :-
  - antibodies and T cell receptors for antigen (TCRs)
  - the transplantation antigens of the major histocompatibility complex (MHC) & human leucocyte antigen (HLA).
  - cell-signaling molecules including the many types of cytokines
  - the molecules that participate in blood clotting.
- Human genome comprises of 2% of exons (coding regions) and 98% of introns (non-coding regions).

APPLICATIONS OF HGP

- The sequencing of the human genome holds benefits for many fields, from **molecular medicine** to human evolution.
- Helps in identifying **disease causing gene**.
- identification of **mutations** linked to different forms of cancer.
- The sequence of the DNA is stored in **databases** available to anyone on the Internet.
- The U.S. National Center for Biotechnology Information (and sister organizations in Europe and Japan) house the gene sequence in a database known as **GenBank**, along with sequences of known and hypothetical genes and proteins.
- will allow for advances in agriculture through **genetic modification** to yield healthier, more disease-resistant crops.
- Benefitted the advancement of **forensic science**.

Several risk factors for Crohn's disease have been identified in recent genome-wide association studies. To advance gene discovery further, we combined data from three studies on Crohn's disease (a total of 3,230 cases and 4,829 controls) and carried out replication in 3,664 independent cases with a mixture of population-based and family-based controls. The results strongly confirm 11 previously reported loci and provide genome-wide significant evidence for 21 additional loci, including the regions containing *STAT3*, *JAK2*, *ICOSLG*, *CDKAL1* and *ITLN1*. The expanded molecular understanding of the basis of this disease offers promise for informed therapeutic development.

Variante des KCNJ11-Gens erhöht das Risiko für Alterszucker auch in deutscher Bevölkerung

17.03.08.

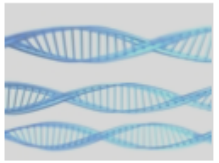

Foto: Shutterstock

Eine Variante des Gens KCNJ11 erhöht be Menschen der Region Berlin/Brandenburg das Risiko für Alterszucker (Typ-2-Diabetes) um bis zu 25 Prozent. Dies ist ein Ergebnis einer großen Bevölkerungsstudie, die Wissenschaftler des Deutschen Instituts für Ernährungsforschung Potsdam-Rehbrücke (DIfE) durchführten. Ferner wiesen die Forscher nach, dass die mit KCNJ11 23K bezeichnete Genvariante sowohl die Insulinausschüttung als auch die Insulinempfindlichkeit negativ beeinflusst.

„Möglicherweise könnte man unsere Ergebnisse in Zukunft dazu nutzen, die Vorhersagekraft von Diabetes-Risikotests zu erhöhen. Zudem helfen die von uns gefundenen funktionellen Daten, die Mechanismen der Diabetesentstehung aufzuklären", erklärt Joachim Spranger, Leiter der wissenschaftlichen Untersuchung. Die Forscher veröffentlichten ihre Ergebnisse in der Januarausgabe der renommierten Fachzeitschrift Diabetes Care (Fischer et al. 2008; 31:87-92).

Grundlage der vorliegenden Untersuchung sind die Daten von 2.945 Teilnehmern der Potsdamer EPIC*-Studie sowie von 1.891 Teilnehmern der MeSyBePo**-Studie. Die Teilnehmer beider Studien stammen aus der Region Berlin/Brandenburg.

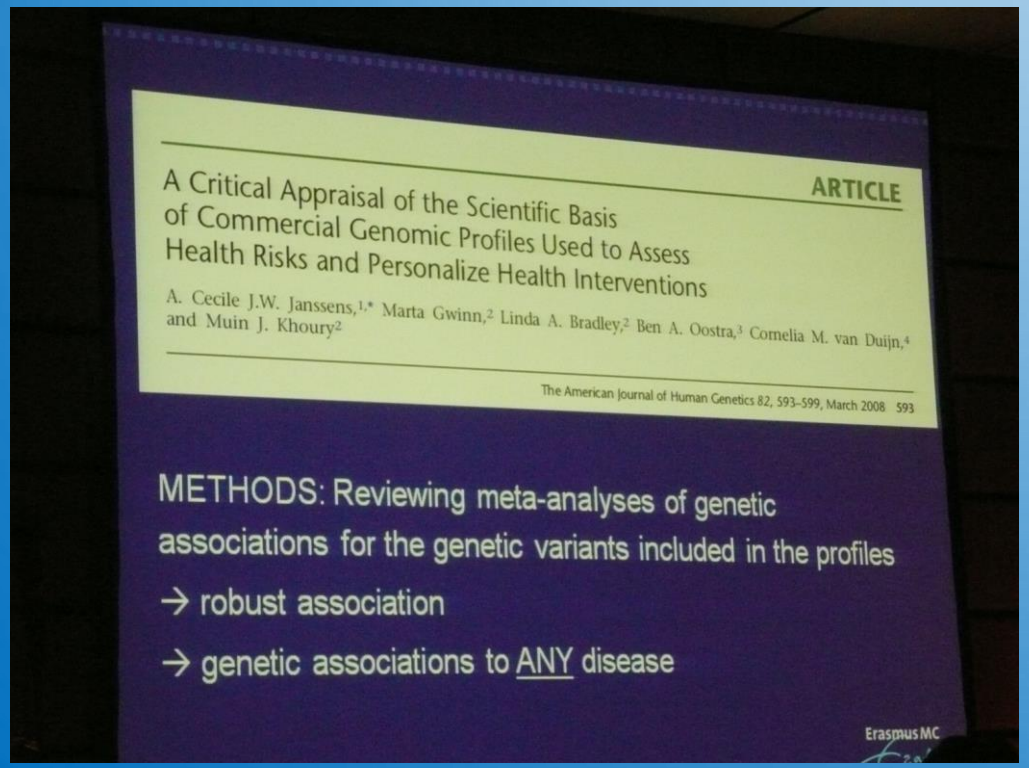
CRITICAL ASPECTS OF GENETIC TESTING FOR CONSUMERS



ARTICLE

A Critical Appraisal of the Scientific Basis of Commercial Genomic Profiles Used to Assess Health Risks and Personalize Health Interventions

A. Cecile J.W. Janssens,[1,*] Marta Gwinn,[2] Linda A. Bradley,[2] Ben A. Oostra,[3] Cornelia M. van Duijn,[4] and Muin J. Khoury[2]

Predictive genomic profiling used to produce personalized nutrition and other lifestyle health recommendations is currently offered directly to consumers. By examining previous meta-analyses and HuGE reviews, we assessed the scientific evidence supporting the purported gene-disease associations for genes included in genomic profiles offered online. We identified seven companies that offer predictive genomic profiling. We searched PubMed for meta-analyses and HuGE reviews of studies of gene-disease associations published from 2000 through June 2007 in which the genotypes of people with a disease were compared with those of a healthy or general-population control group. The seven companies tested at least 69 different polymorphisms in 56 genes. Of the 56 genes tested, 24 (43%) were not reviewed in meta-analyses. For the remaining 32 genes, we found 260 meta-analyses that examined 160 unique polymorphism-disease associations, of which only 60 (38%) were found to be statistically significant. Even the 60 significant associations, which involved 29 different polymorphisms and 28 different diseases, were generally modest, with synthetic odds ratios ranging from 0.54 to 0.88 for protective variants and from 1.04 to 3.2 for risk variants. Furthermore, genes in cardiogenomic profiles were more frequently associated with noncardiovascular diseases than with cardiovascular diseases, and though two of the five genes of the osteogenomic profiles did show significant associations with disease, the associations were not with bone diseases. There is insufficient scientific evidence to conclude that genomic profiles are useful in measuring genetic risk for common diseases or in developing personalized diet and lifestyle recommendations for disease prevention.

Epigenetic Transgenerational Actions of Endocrine Disruptors and Male Fertility

Matthew D. Anway, Andrea S. Cupp,* Mehmet Uzumcu,† Michael K. Skinner‡

Transgenerational effects of environmental toxins require either a chromosomal or epigenetic alteration in the germ line. Transient exposure of a gestating female rat during the period of gonadal sex determination to the endocrine disruptors vinclozolin (an antiandrogenic compound) or methoxychlor (an estrogenic compound) induced an adult phenotype in the F_1 generation of decreased spermatogenic capacity (cell number and viability) and increased incidence of male infertility. These effects were transferred through the male germ line to nearly all males of all subsequent generations examined (that is, F_1 to F_4). The effects on reproduction correlate with altered DNA methylation patterns in the germ line. The ability of an environmental factor (for example, endocrine disruptor) to reprogram the germ line and to promote a transgenerational disease state has significant implications for evolutionary biology and disease etiology.

Histone modification
The binding of epigenetic factors to histone "tails" alters the extent to which DNA is wrapped around histones and the availability of genes in the DNA to be activated.
Histones are proteins around which DNA can wind for compaction and gene regulation.

THREE MAIN TYPES OF EPIGENETIC INFORMATION

The three main types of epigenetic information

Cytosine DNA methylation is a covalent modification of DNA, in which a methyl group is transferred from *S-adenosylmethionine to the C-5 position of cytosine by a family of cytosine* (DNA-5)-methyltransferases. DNA methylation occurs almost exclusively at CpG nucleotides and has an important contributing role in the regulation of gene expression and the silencing of repeat elements in the genome.

Genomic imprinting is parent-of-origin-specific allele silencing, or relative silencing of one parental allele compared with the other parental allele. It is maintained, in part, by differentially methylated regions within or near imprinted genes, and it is normally reprogrammed in the germline.

Histone modifications — including acetylation, methylation and phosphorylation — are important in transcriptional regulation and many are stably maintained during cell division, although the mechanism for this epigenetic Inheritance is not yet well understood. Proteins that mediate these modifications are often associated within the same complexes as those that regulate DNA methylation.

ABSTRACT

This review describes new developments in the study of transgenerational epigenetic inheritance, a component of epigenetics. We start by examining the basic concepts of the field and the mechanisms that underlie epigenetic inheritance. We present a comprehensive review of transgenerational cellular epigenetic inheritance among different taxa in the form of a table, and discuss the data contained therein. The analysis of these data shows that epigenetic inheritance is ubiquitous and suggests lines of research that go beyond present approaches to the subject. We conclude by exploring some of the consequences of epigenetic inheritance for the study of evolution, while also pointing to the importance of recognizing and understanding epigenetic inheritance for practical and theoretical issues in biology.

trics 2009, 21:243–251

Purpose of review

Epigenetics investigates heritable changes in gene expression occurring without changes in DNA sequence. Several epigenetic mechanisms, including DNA methylation, histone modifications, and microRNA expression, can change genome function under exogenous influence. Here, we review current evidence indicating that epigenetic alterations mediate toxicity from environmental chemicals.

Recent findings

In-vitro, animal, and human investigations have identified several classes of environmental chemicals that modify epigenetic marks, including metals (cadmium, arsenic, nickel, chromium, and methylmercury), peroxisome proliferators (trichloroethylene, dichloroacetic acid, and TCA), air pollutants (particulate matter, black carbon, and benzene), and endocrine-disrupting/reproductive toxicants (diethylstilbestrol, bisphenol A, persistent organic pollutants, and dioxin). Most studies conducted so far have been centered on DNA methylation, whereas only a few investigations have studied environmental chemicals in relation to histone modifications and microRNA.

Summary

For several exposures, it has been proved that chemicals can alter epigenetic marks, and that the same or similar epigenetic alterations can be found in patients with the disease of concern or in diseased tissues. Future prospective investigations are needed to determine whether exposed individuals develop epigenetic alterations over time and, in turn, which such alterations increase the risk of disease. Also, further research is needed to determine whether environmental epigenetic changes are transmitted transgenerationally.

ABSTRACT

Exposure to hostile conditions results in a series of coordinated responses aimed at enhancing the probability of survival. The activation of the hypothalamo-pituitary-adrenocortical (HPA) axis plays a pivotal role in the stress response. While the short-term activation of the HPA axis allows adaptive responses to the challenge, in the long run this can be devastating for the organism. In particular, life events occurring during the perinatal period have strong long-term effects on the behavioral and neuroendocrine response to stressors. In male and female rats exposed to prenatal restraint stress (PRS), these effects include a long-lasting hyperactivation of the HPA response associated with an altered circadian rhythm of corticosterone secretion. Furthermore, male animals exhibit sleep disturbances. In males, these HPA dysfunctions have been reported in infant, young, adult and aged animals, thus suggesting a permanent effect of early stress. Interestingly, after exposure to an intense inescapable footshock, female PRS rats durably exhibit a blunted corticosterone secretion response to stress. In male PRS rats exposed to an alcohol challenge, the HPA axis is similarly hyporesponsive. Rats exposed to PRS also show behavioral disturbances. Both male and female PRS rats show high anxiety levels and depression-like behavior during adulthood, although some studies suggest that female PRS rats present low anxiety levels. With ageing, male and female PRS rats exhibit memory impairments in hippocampus-dependent tasks, while female PRS rats improve their memory performance during adulthood. The gender effect on behavior seems to be related to a reduction in hippocampal plasticity in male PRS rats, and an increase in female PRS rats. Despite the permanent imprinting induced by early stress, the dysfunctions observed after PRS can be reversed by environmental or pharmacological strategies such as environmental enrichment or antidepressive and neurotrophic treatments. Mechanisms underlying the effects of PRS on the offspring remain largely unknown. However, previous studies have demonstrated that maternal glucocorticoids during pregnancy play an important role in the HPA disturbances reported

Epigenetic mechanisms and the transgenerational effects of maternal care

Frances A. Champagne *

Department of Psychology, Columbia University, Room 406, Schermerhorn Hall, 1190 Amsterdam Avenue, New York, NY 10017, USA

Available online 28 March 2008

Abstract

The transmission of traits across generations has typically been attributed to the inheritance by offspring of genomic information from parental generations. However, recent evidence suggests that epigenetic mechanisms are capable of mediating this type of transmission. In the case of maternal care, there is evidence for the behavioral transmission of postpartum behavior from mothers to female offspring. The neuroendocrine and molecular mediators of this transmission have been explored in rats and implicate estrogen–oxytocin interactions and the differential methylation of hypothalamic estrogen receptors. These maternal effects can influence multiple aspects of neurobiology and behavior of offspring and this particular mode of inheritance is dynamic in response to environmental variation. In this review, evidence for the generational transmission of maternal care and the mechanisms underlying this transmission will be discussed as will the implications of this inheritance system for offspring development and for the transmission of environmental information from parents to offspring.

Epigenetic Influence of Social Experiences Across the Lifespan

ABSTRACT: *The critical role of social interactions in driving phenotypic variation has long been inferred from the association between early social deprivation and adverse neurodevelopmental outcomes. Recent evidence has implicated molecular pathways involved in the regulation of gene expression as one possible route through which these long-term outcomes are achieved. These epigenetic effects, though not exclusive to social experiences, may be a mechanism through which the quality of the social environment becomes embedded at a biological level. Moreover, there is increasing evidence for the transgenerational impact of these early experiences mediated through changes in social and reproductive behavior exhibited in adulthood. In this review, recent studies which highlight the epigenetic effects of parent–offspring, peer and adult social interactions both with and across generations will be discussed and the implications of this research for understanding the developmental origins of individual differences in brain and behavior will be explored.* © *2010 Wiley Periodicals, Inc.* Dev Psychobiol

Keywords: *epigenetic; maternal; social; transgenerational; development*

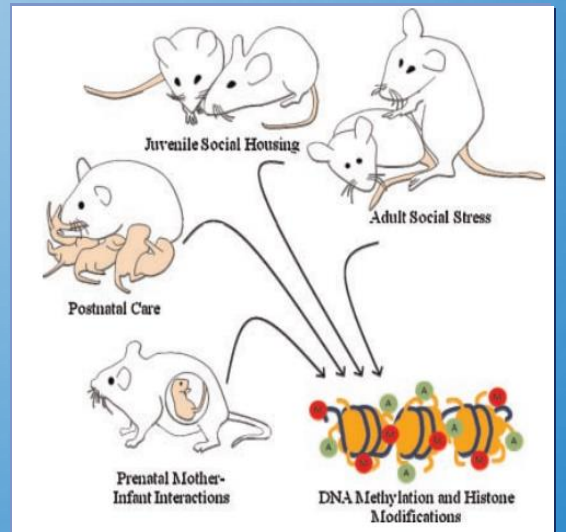

FIGURE 1 Epigenetic consequences of social experiences across the lifespan. Emerging evidence suggests that prenatal environmental exposures, postnatal mother–infant interactions, juvenile social rearing, and adult social stress can alter epigenetic processes such as DNA methylation (red circles) and histone acetylation (green circles)/methylation with long-term consequences for gene expression, physiology, and behavior.

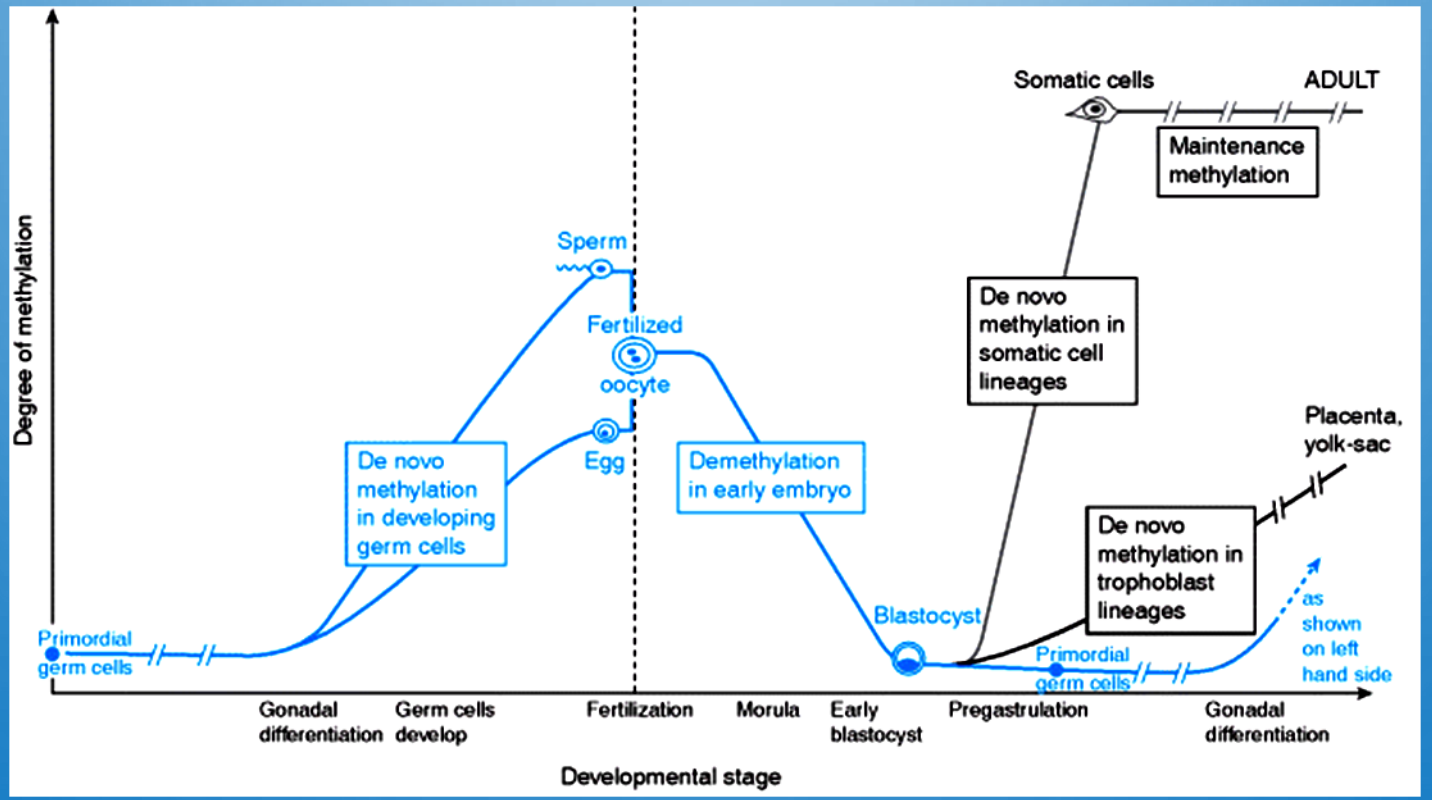
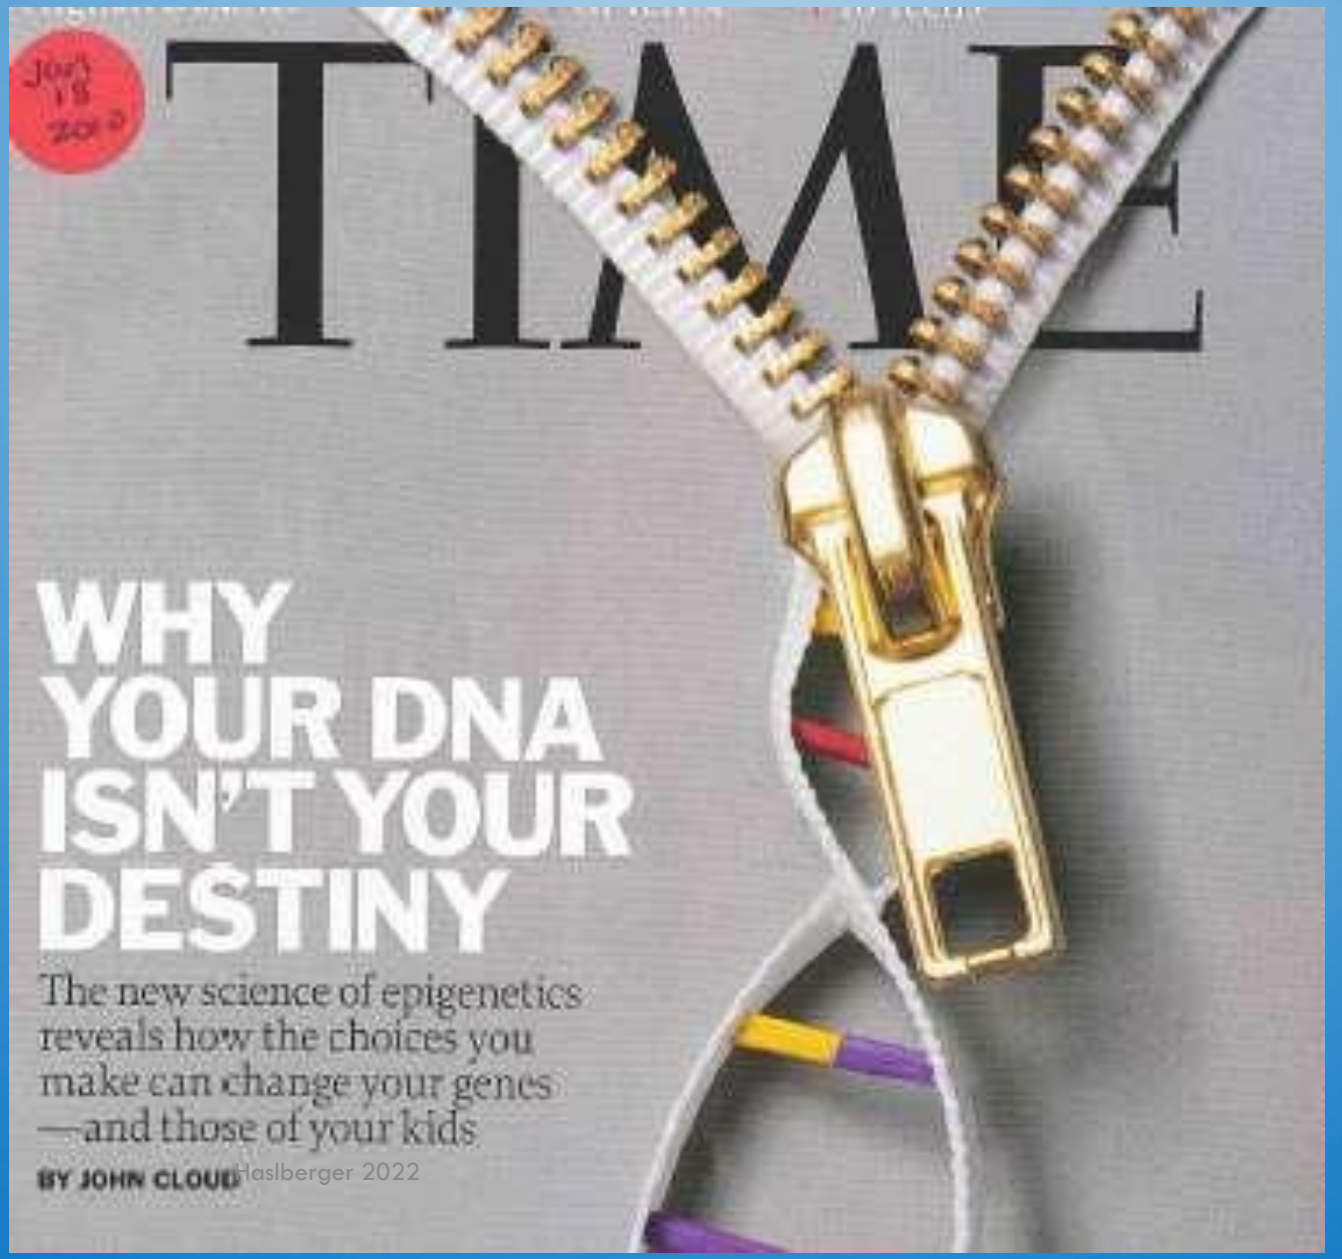
LIFE TIME CHANGES IN DNA METHYLATION EPIGENETIC TISSUE SPECIFIC, TRANSGENERATIONAL BUT HOW ?



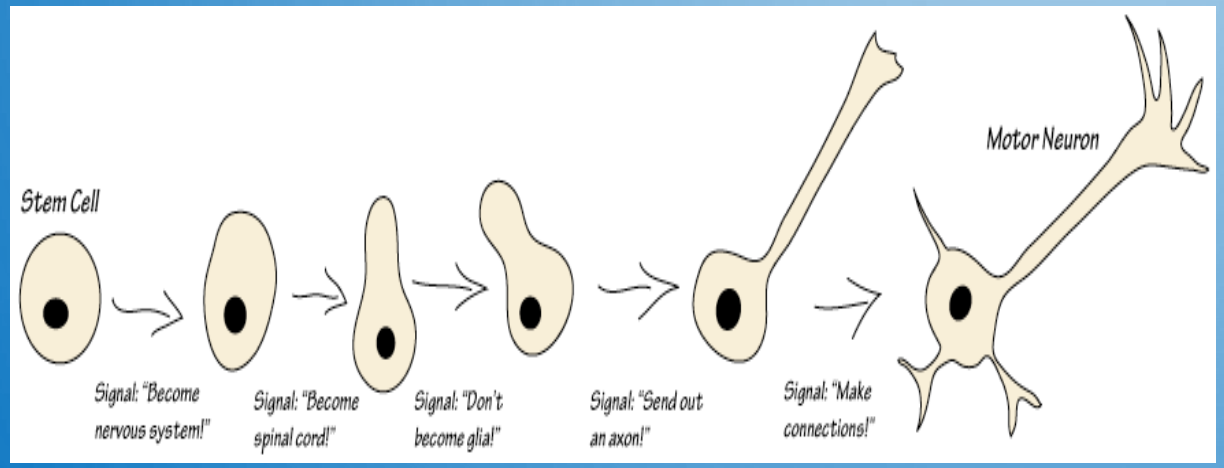


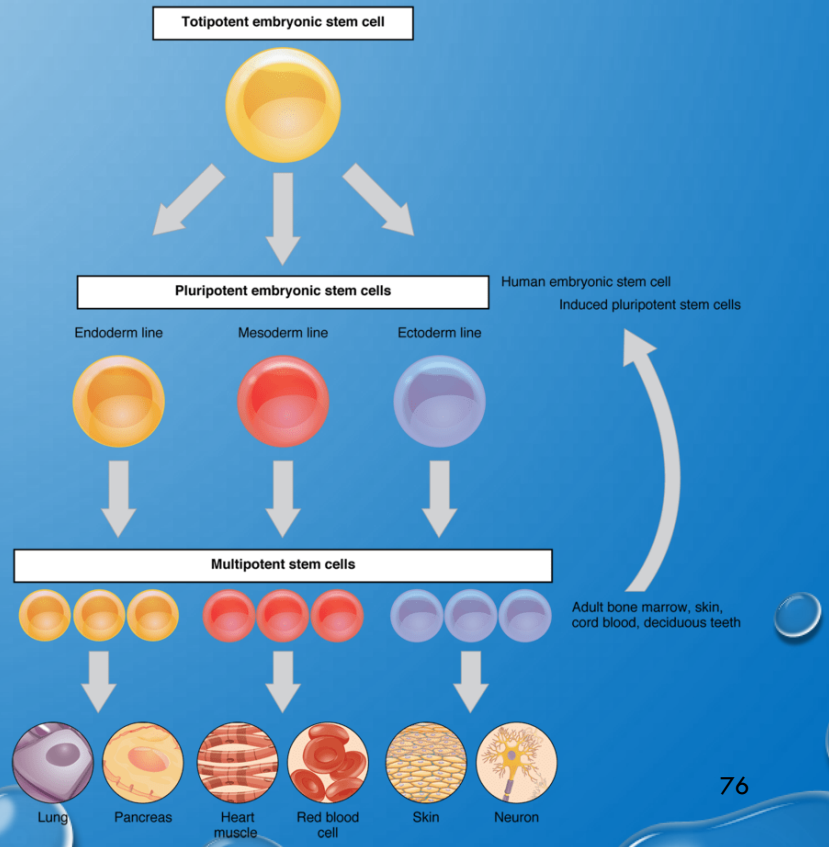
TIME
WHY YOUR DNA ISN'T YOUR DESTINY
The new science of epigenetics reveals how the choices you make can change your genes —and those of your kids
BY JOHN CLOUD

The term epigenetics refers to heritable changes in gene expression (active versus inactive genes) that does not involve changes to the underlying DNA sequence; a change in phenotype without a change in genotype.

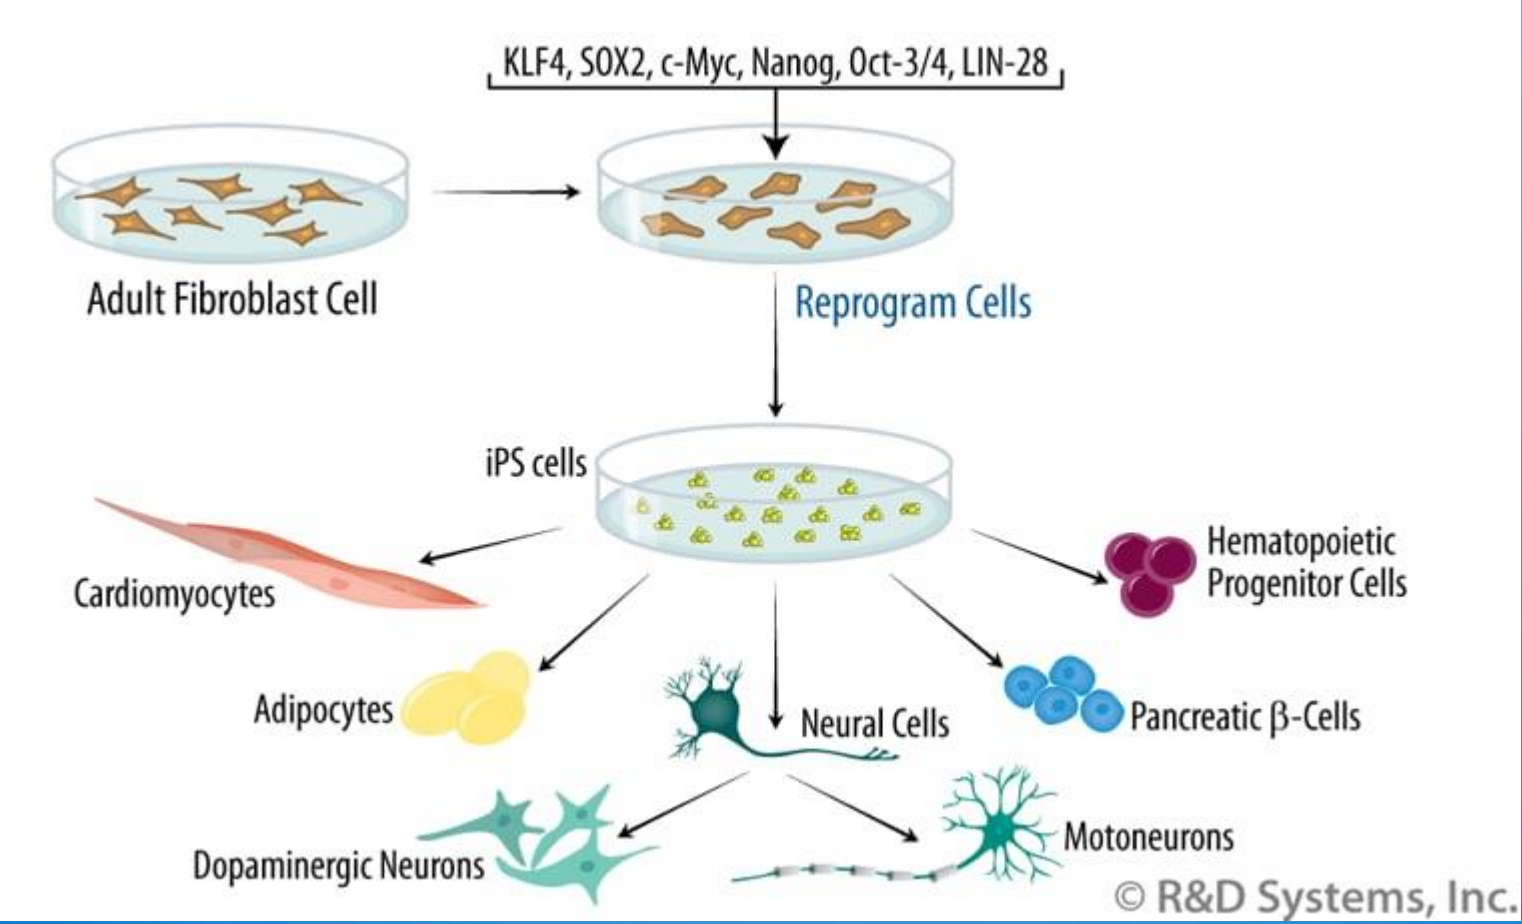
- The term epigenetics, which was coined by Conrad H. Waddington in 1942, was derived from the Greek word “epigenesis” which originally described the influence of genetic processes on development. Conrad H. Waddington and Ernst Hadorn, started the study of epigenetics.

EPIGENETICS IN DIFFERENTIATION



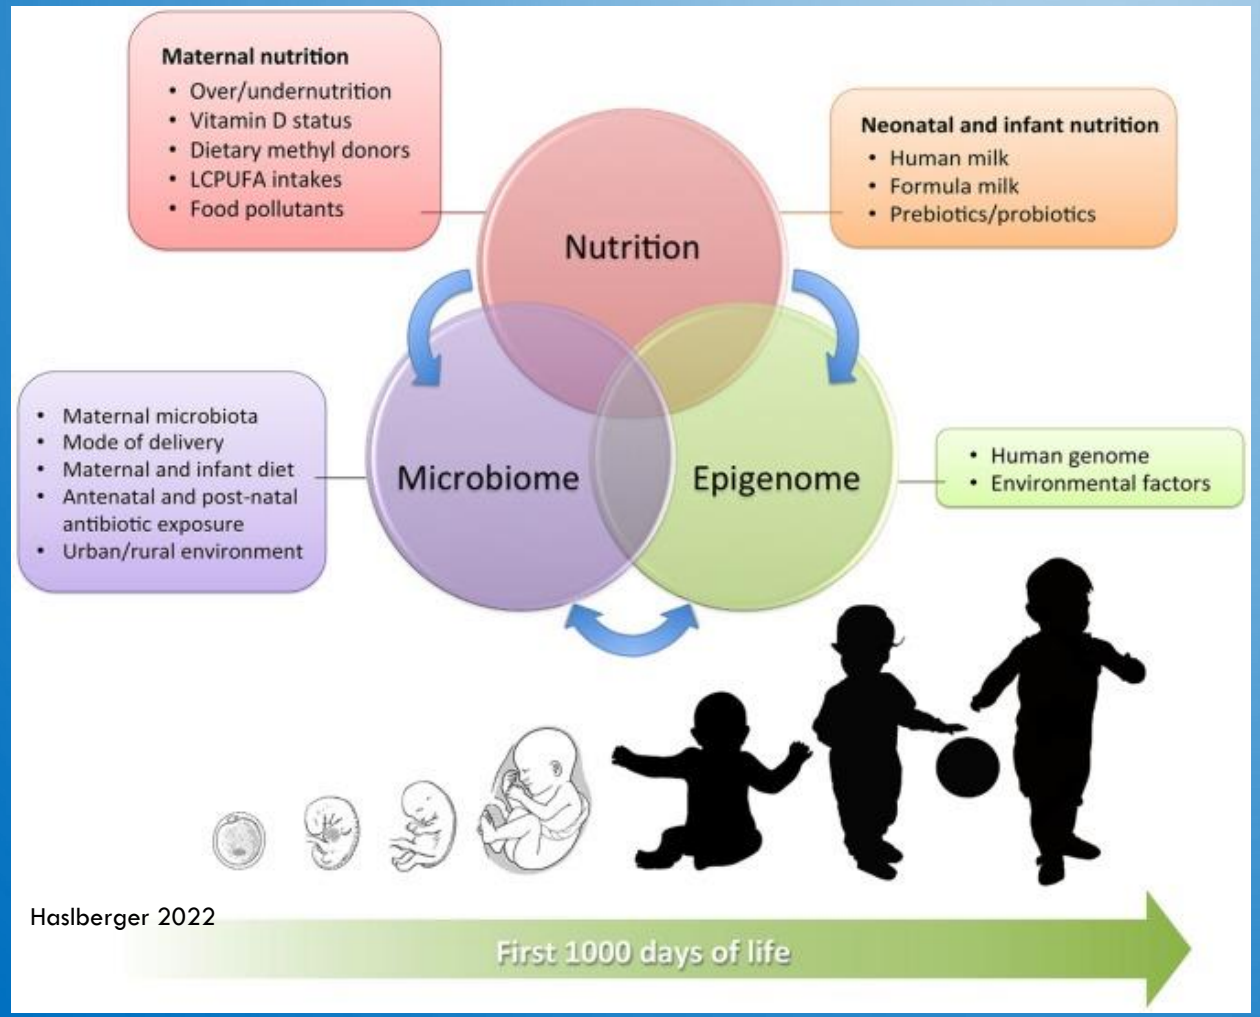


EPIGENETICS IN RE-DIFFERENTIATION



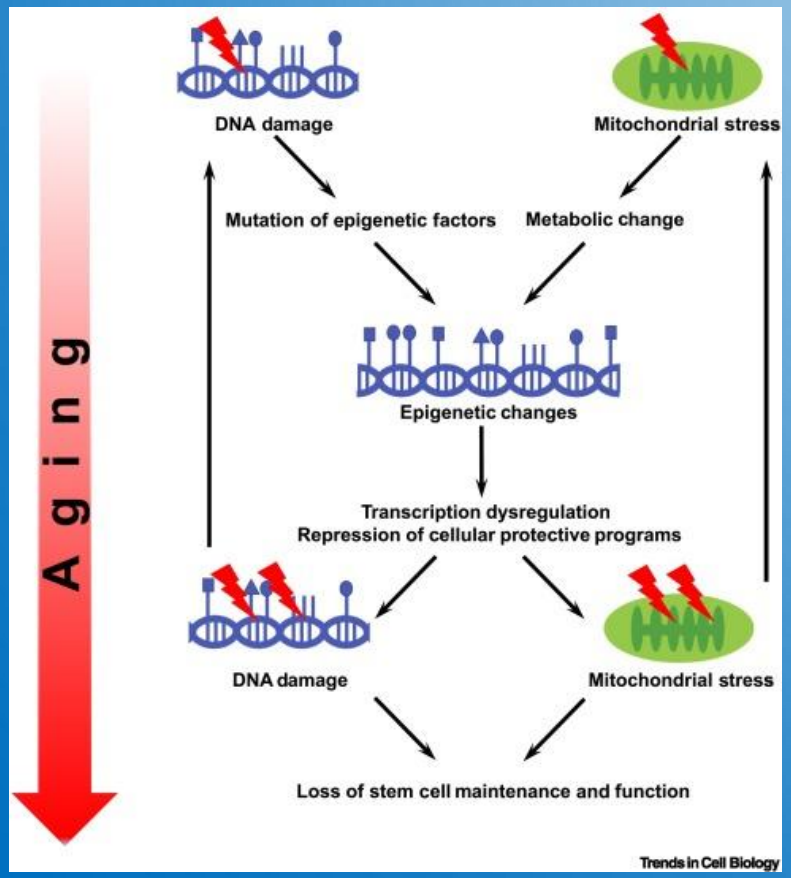
. For most cell types, four factors (c-Myc, Oct-3/4, SOX2, and KLF4) are used

THE FIRST 1000 DAYS OF LIFE



- Epigenetic tags act as a kind of **cellular memory**. A cell's epigenetic profile -- a collection of tags that tell genes whether to be on or off -- is the sum of the signals it has received during its lifetime.
- First 100 days of life imprinting

EVEN INTO OLD AGE, EPIGENETICS AND STEM CELLS



DURING THESE PROCESSES, JUST LIKE DURING EMBRYONIC DEVELOPMENT, THE CELL'S EXPERIENCES ARETRANSFERRED TO THE EPIGENOME, WHERE THEY SHUT DOWN AND ACTIVATE SPECIFIC SETS OF GENES.

EPIGENETIC DIEASES MENTAL RETARDATION DISORDERS

- Epigenetic changes are also linked to several disorders that result in intellectual disabilities such as ATR-X, Fragile X, Rett, Beckwith-Weidman (BWS), Prader-Willi and Angelman syndromes. For example, the imprint disorders Prader-Willi syndrome and Angelman syndrome, display an abnormal phenotype as a result of the absence of the paternal or maternal copy of a gene, respectively.

NEUROPSYCHIATRIC DISORDERS

- Epigenetic errors also play a role in the causation of complex adult psychiatric, autistic, and neurodegenerative disorders. Several reports have associated schizophrenia and mood disorders with DNA rearrangements that include the DNMT genes.

NEUROPSYCHIATRIC DISORDERS

- DNMT1 is selectively overexpressed in gamma-aminobutyric acid (GABA)-ergic interneurons of schizophrenic brains,
  whereas hypermethylation has been shown to repress expression of Reelin (a protein required for normal neurotransmission, memory formation and synaptic plasticity) in brain tissue from patients with schizophrenia and patients with bipolar illness and psychosis.

DNA METHYLATION

- DNA methylation is an epigenetic mechanism used by cells to control gene expression. A number of mechanisms exist to control gene expression in eukaryotes, but DNA methylation is a commonly used epigenetic signaling tool that can fix genes in the “off” position.

Isomerized proline (Pisom)	H3 (30–38)	Activation/repression

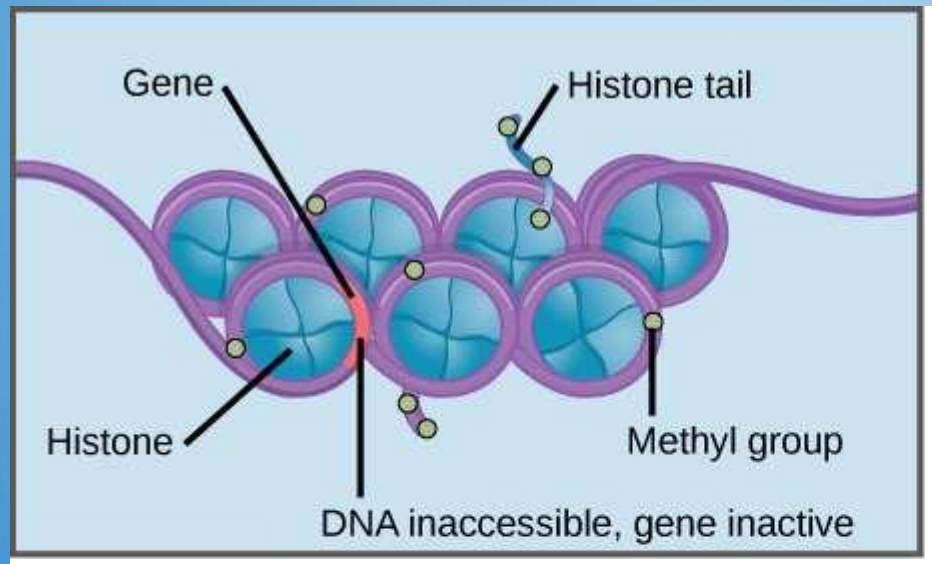
HISTONE MODIFICATION

- Histones are subject to a wide variety of posttranslational modifications including but not limited to, lysine acetylation, lysine and arginine methylation, serine and threonine phosphorylation, and lysine ubiquitination and sumoylation (Vasquero 2003). These modifications occur primarily within the histone amino-terminal tails protruding from the surface of the nucleosome as well as on the globular core region (Cosgrove 2004).

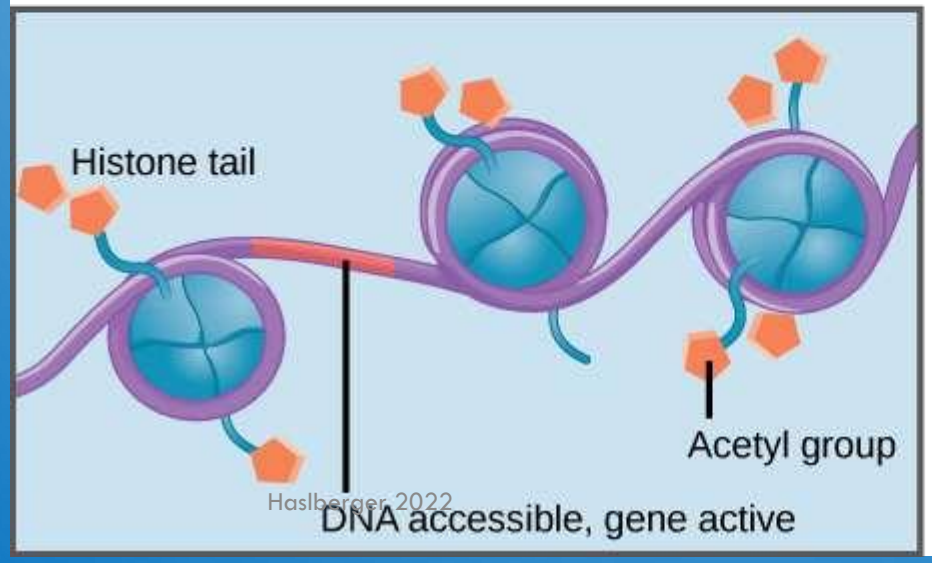
HISTONE MODIFICATION

- Histone modifications are proposed to affect chromosome function through at least two distinct mechanisms. The first mechanism suggests modifications may alter the electrostatic charge of the histone resulting in a structural change in histones or their binding to DNA.

- The second mechanism proposes that these modifications are binding sites for protein recognition modules, such as the bromodomains or chromodomains, that recognize acetylated lysines or methylated lysine, respectively.

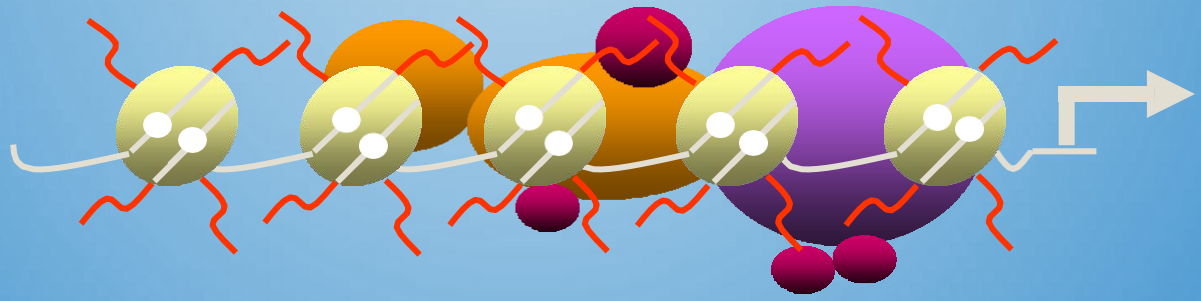


Methylation of DNA and histones causes nucleosomes to pack tightly together. Transcription factors cannot bind the DNA, and genes are not expressed.

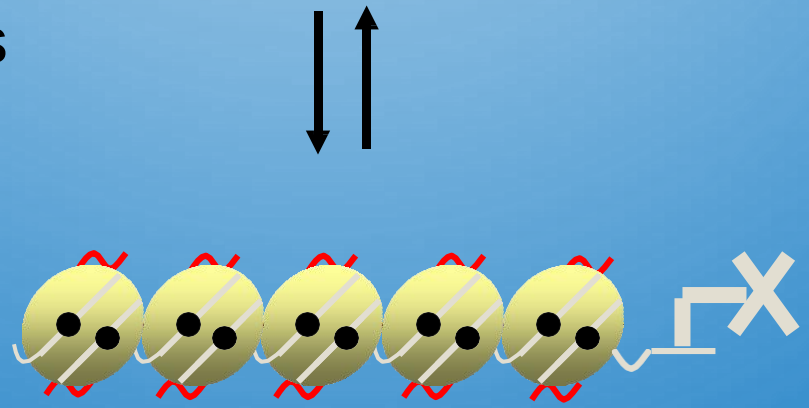


Histone acetylation results in loose packing of nucleosomes. Transcription factors can bind the DNA and genes are expressed.

EFFECT OF HISTONE MODIFICATION



Methylation turns off genes. Acetylation turn genes on.



Methylated DNA

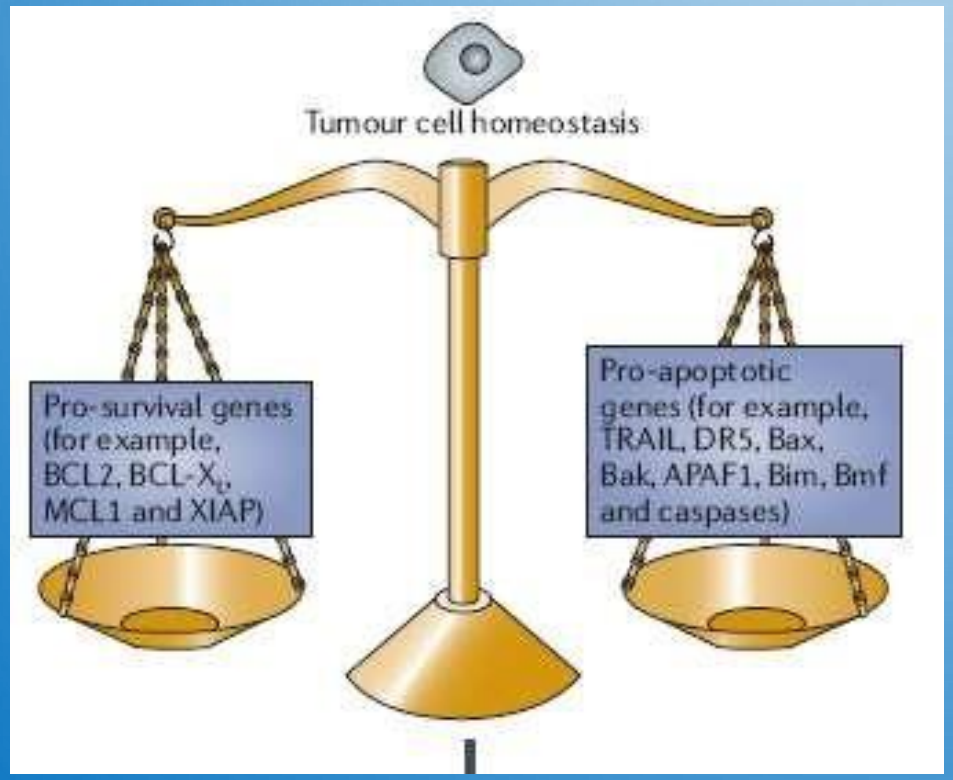
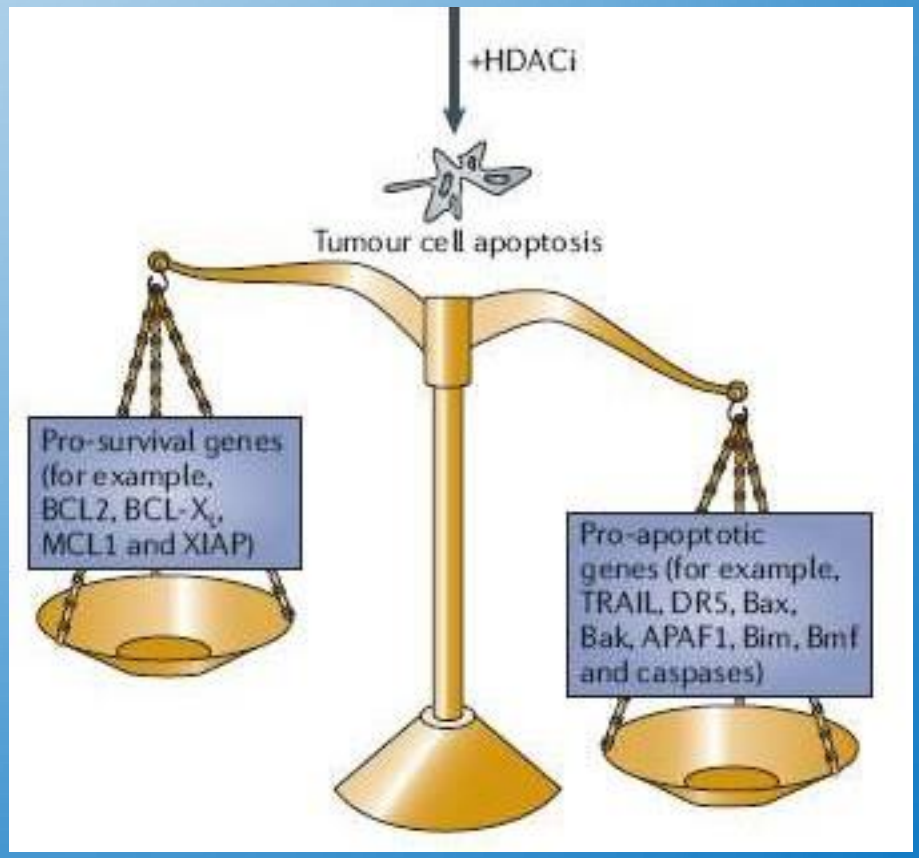
HISTONE MODIFICATIONS AND HUMAN DISEASES

Coffin-Lowry syndrome is a rare genetic disorder characterized by mental retardation and abnormalities of the head and facial and other areas. It is caused by mutations in the RSK2 gene (histone phosphorylation) and is inherited as an X-linked dominant genetic trait. Males are usually more severely affected than females.

Rubinstein-Taybi syndrome is characterized by short stature, moderate to severe intellectual disability, distinctive facial features, and broad thumbs and first toes. It is caused by mutations in CREB-binding protein (histone acetylation)

HISTONE MODIFICATION INTERFERS WITH APOPTOSIS

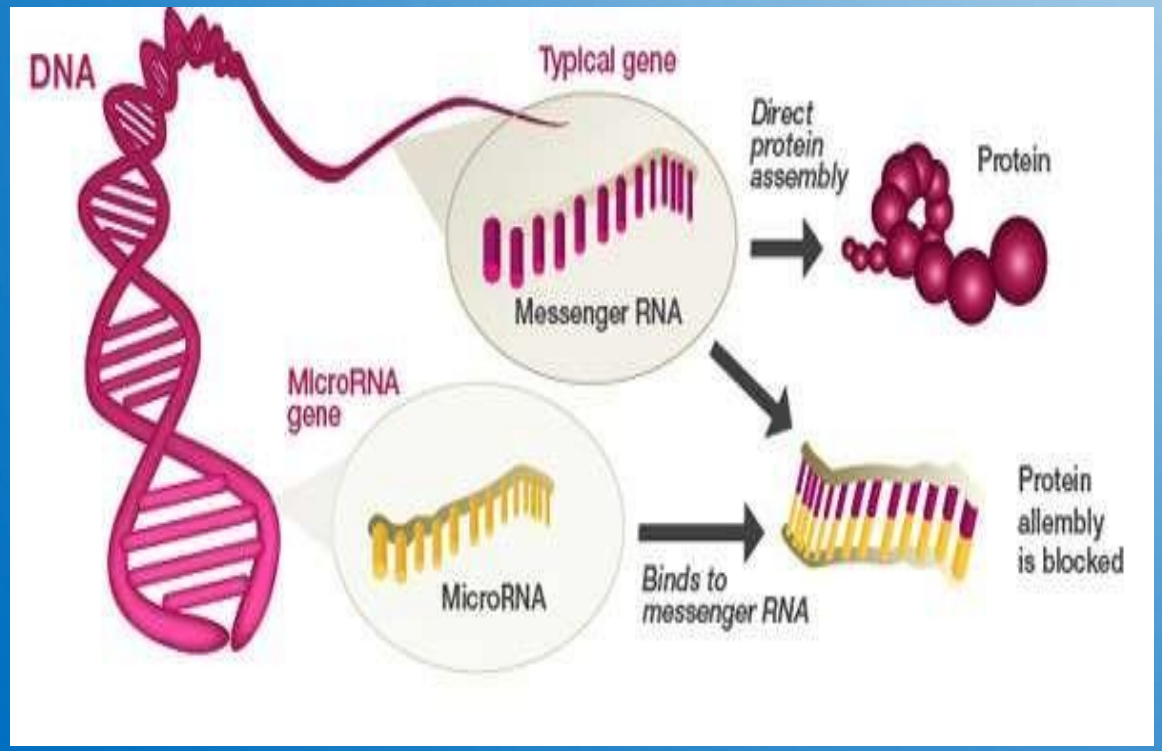




NON-CODING RNA (NCRNA)-ASSOCIATED GENE

- miRNAs or ncRNA represent small RNA molecules encoded in the genomes of plants and animals. These highly conserved 22 nucleotides long RNA sequences regulate the expression of genes by binding to the 3'-untranslated regions (3'-UTR) of specific mRNAs. A growing body of evidence shows that miRNAs are one of the key players in cell differentiation and growth, mobility and apoptosis (programmed cell death).

RNA INTERFERENCE



- miRNAs regulate diverse aspects of development and physiology, thus understanding its biological role is proving more and more important. Analysis of miRNA expression may provide valuable information, as dysregulation of its function can lead to human diseases such as cancer, cardiovascular and metabolic diseases, liver conditions and immune dysfunction.

Simple Summary: Blood-based tests for cancer detection are minimally invasive and could be useful for screening asymptomatic patients and high-risk populations. Since a single molecular biomarker is usually insufficient for an accurate diagnosis, we developed a multi-analyte liquid biopsy-based classification model to distinguish cancer patients from healthy subjects. The combination of cell-free DNA mutations, miRNAs, and cell-free DNA methylation markers improved the model's performance. Moreover, we demonstrated that the androgen receptor mutation p.H875Y is not only relevant in prostate cancer but had a strong predictive value for colorectal, bladder, and breast cancer. Our results, although preliminary, showed that a single liquid biopsy test could detect multiple cancer types simultaneously.

CANCER EPIGENETICS

- A COMMON PARADIGM OF CANCER EPIGENETICS IS HYPERMETHYLATION OF CPG ISLAND OF TUMOR SUPPRESSOR GENE PROMOTER
- HYPERMETHYLATED PROMOTER DNA IS ASSOCIATED WITH VIRTUALLY EVERY TYPE OF HUMAN TUMOR
- WITH EACH TYPE OF TUMOR HAVING OWN SIGNATURE OF METHYLATED GENES

CANCER EPIGENETICS, EXAMPLES

Cancer	Methylated genes
Prostate	GSTP1
Renal	VHL
Colon and endometrial	MLH1 (mismatch repair gene)
Esophageal	APC

Glutathione S-transferases

Hippel–Lindau tumor suppressor

Tumor suppresssor

Cancer epigenetics, examples

- Global hypomethylation: overall in 5-methylcytosine content in the genome
  - Found in premalignant and early stages of some neoplasm
  - Important in tumor progression

- Gene-specific hypomethylation:
  - Often affect promoter region of proto-oncogene and oncogene which are normally highly methylated

If they could turn back time: how tech billionaires are trying to reverse the ageing process

Jeff Bezos and Peter Thiel are pouring huge sums into startups aiming to keep us all young – or even cheat death. And the science isn't as far-fetched as you might think

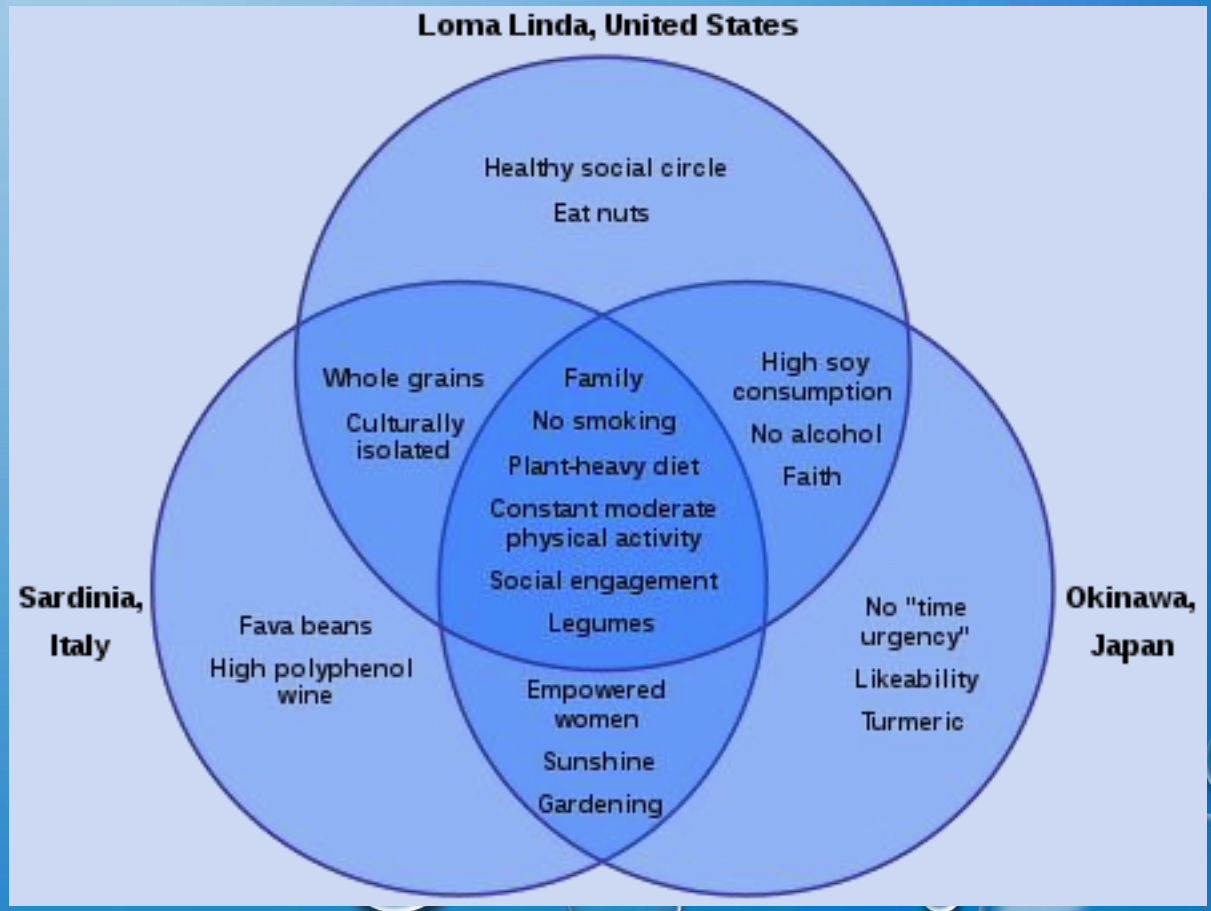
BLUEZONES

Blaue Zonen sind Regionen der Welt in denen Menschen viel länger als der Durchschnitt leben sollen. Das Konzept wird von Dan Buettner vertreten und wurde erstmals im November 2005 im Magazin National Geographic in der Titelgeschichte „The Secrets of a Long Life“ von Buettner vorgestellt.

Buettner identifizierte fünf Regionen, die er als „Blaue Zonen“ betrachtet: Okinawa (Japan), Sardinien (Italien), die Nicoya-Halbinsel (Costa Rica), Ikaria (Griechenland) und unter den Siebenten-Tags-Adventisten in Loma Linda, Kalifornien.

Er gibt eine Erklärung, basierend auf Daten und Beobachtungen aus erster Hand, warum diese Bevölkerungs-gruppen gesünder und länger leben.

VON DEN BLUEZONES LERNEN WIR PERSÖNLICHE, REGIONAL SPEZIFISCHE MASSNAHMEN GEGEN VORZEITIGES ALTERN, ALTERS-BEDINGTE ERKRANKUNGEN, ZENTRAL: BIOAKTIVE MOLEKÜLE



Haslberger 2022

Die Menschen in den Blauen Zonen haben gemeinsame Lebensstil-Merkmale, die zu ihrer Langlebigkeit beitragen. Sechs gemeinsamen Merkmale der Menschen in Okinawa, Sardinien und den Blauen Zonen von Loma Linda:

- Familie – wichtiger als andere Anliegen
- Nicht rauchen
- Pflanzenbasierte Ernährung – der Großteil der verzehrten Nahrung stammt aus Pflanzen.
- Ständige moderate körperliche Aktivität – ein untrennbarer Bestandteil des Lebens.
- Soziales Engagement – Menschen jeden Alters sind sozial aktiv und in ihre Gemeinschaften integriert.
- Hülsenfrüchte – häufig konsumiert

Buettner: Faktoren die den Lebensstil der Menschen in den blauen Zonen behandeln:

- Mäßige, regelmäßige körperliche Aktivität.
- Lebensinhalt.
- Stressabbau.
- Mäßige Kalorienzufuhr.
- Pflanzenbasierte Ernährung.
- Mäßiger Alkoholkonsum; überwiegend Wein.
- Engagement in der Spiritualität oder Religion.
- Engagement im Familienleben.
- Engagement im gesellschaftlichen Leben.

Prevent Alzheimer's Disease with 4 Brain-Boosting Habits

If you ask the very old in the blue zones region of Ikaria how they live to be 100, they might say it's the leisurely pace of island life, the ocean breeze, the wine consumed with friends, wild herbal tea, or perhaps, as one Ikarian woman put it, "We just forget to die." Their extreme longevity is a combination of many lifestyle habits, leading them to experience a life virtually free from age-related diseases, including dementia, which affects more than 5 million people in the United States.

While there is currently no cure and no single silver bullet to prevent dementia and Alzheimer's disease, there is a combination of many simple lifestyle factors that can help you live a longer,

STRATEGIEN GEGEN DAS VERGESSEN

Become a Master (in just about anything!)
Learn a language, pick up an instrument, take a class, or find a new hobby. Challenging yourself to master new skills can trigger pathways that help you maintain cognitive function into old age. No matter your education or income, learning something new, reading the newspaper, or even watching YouTube videos to learn how to garden can protect you from a decline in cognitive ability.

Drink Moderately
Your weekly happy hour is good for more than just your social circle. Studies show moderate drinkers have a lower chance of mortality and an increased chance of maintaining cognitive abilities into old age. Red wine, particularly Cannonau from Sardinia, is a great choice due to its high resveratrol content.

Eat Like You're Greek
Similar to the traditional Mediterranean diet, Ikarians eat wild greens, beans, nuts, seeds, fruits, whole grains, and olive oil. Many of these foods are high in folate, which has been shown to improve cognitive processes. Olive oil, nuts, and seeds

Say "Om"
Chronic stress leads to inflammation and is the foundation for every age-related disease, including Alzheimer's and dementia. Centenarians in the blue zones regions of the world have effective ways to manage stress on a daily basis. For Sardinians, this means a glass of wine and a chat with friends at the end of the day.

Schlussfolgerung des Autors

Die Evidenz zu Nahrungsergänzung mit Vitaminen und Mineralien als Behandlung für MCI ist sehr begrenzt. Dreijährige Behandlung mit hochdosiertem Vitamin E reduziert wahrscheinlich nicht das Risiko der Entwicklung einer Demenz. Allerdings haben wir keine Daten zu diesem Endpunkt für andere Nahrungsergänzungsmittel. Nur B-Vitamine wurden in mehr als einer RCT untersucht. Es besteht keine Evidenz zu nutzbringenden Auswirkungen der Supplementierung mit B-Vitaminen für sechs bis 24 Monate auf die Kognition. Evidenz aus einer einzigen

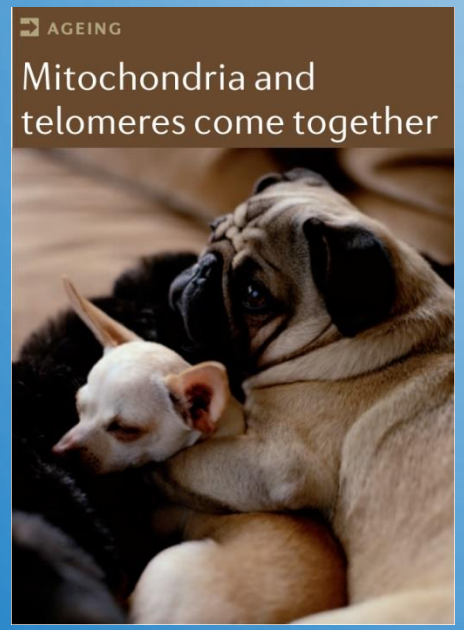
AGEING: NATURE: TELOMERS AND GENOTOXIC STRESS ?



ORIGINAL RESEARCH PAPER Sahin, E. *et al.* Telomere dysfunction induces metabolic and mitochondrial compromise. *Nature* **470**, 359–365 (2011)

> telomere dysfunction can lead to defects in mitochondrial biology

There are mixed views as to what makes us age: one hypothesis proposes that ageing is caused by accumulating genotoxic stress provoked by the progressive loss of telomeres, which leads to replicative senescence and apoptosis, whereas another postulates that ageing is the result of progressive mitochondrial malfunction. A study by DePinho and colleagues now brings these two theories together by identifying a direct molecular link between telomere and mitochondrial dysfunction.

In highly proliferative tissues, age-related telomere decline is associated with telomere dysfunction and

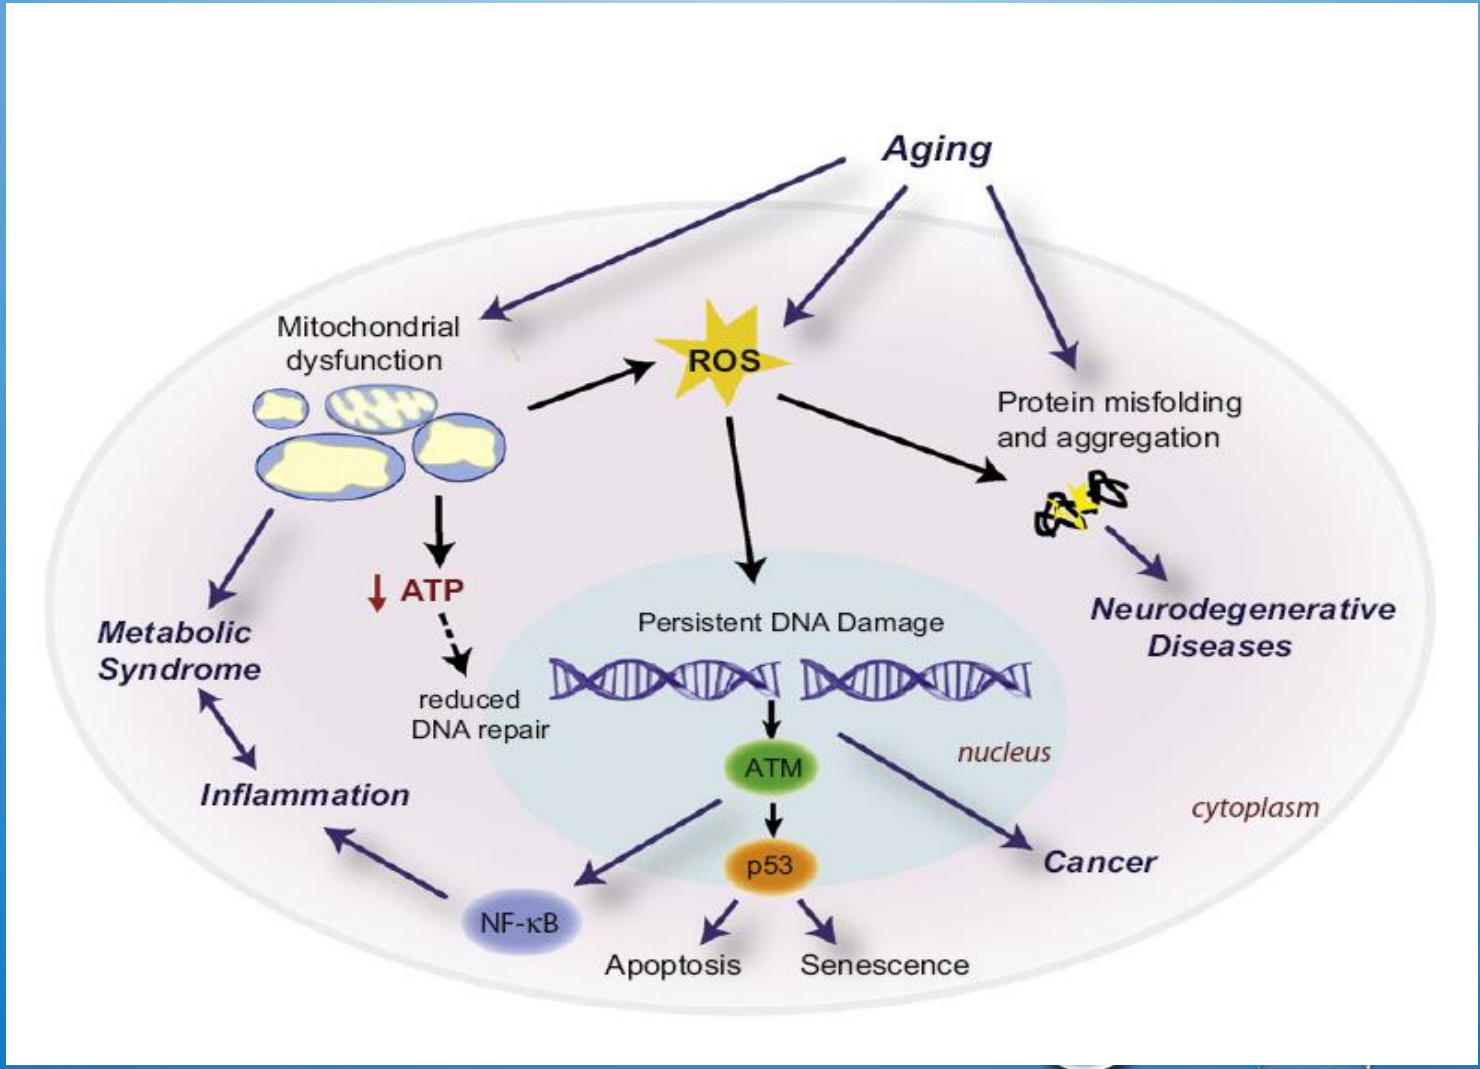
METHODS FOR TELOMERE ANALYSIS

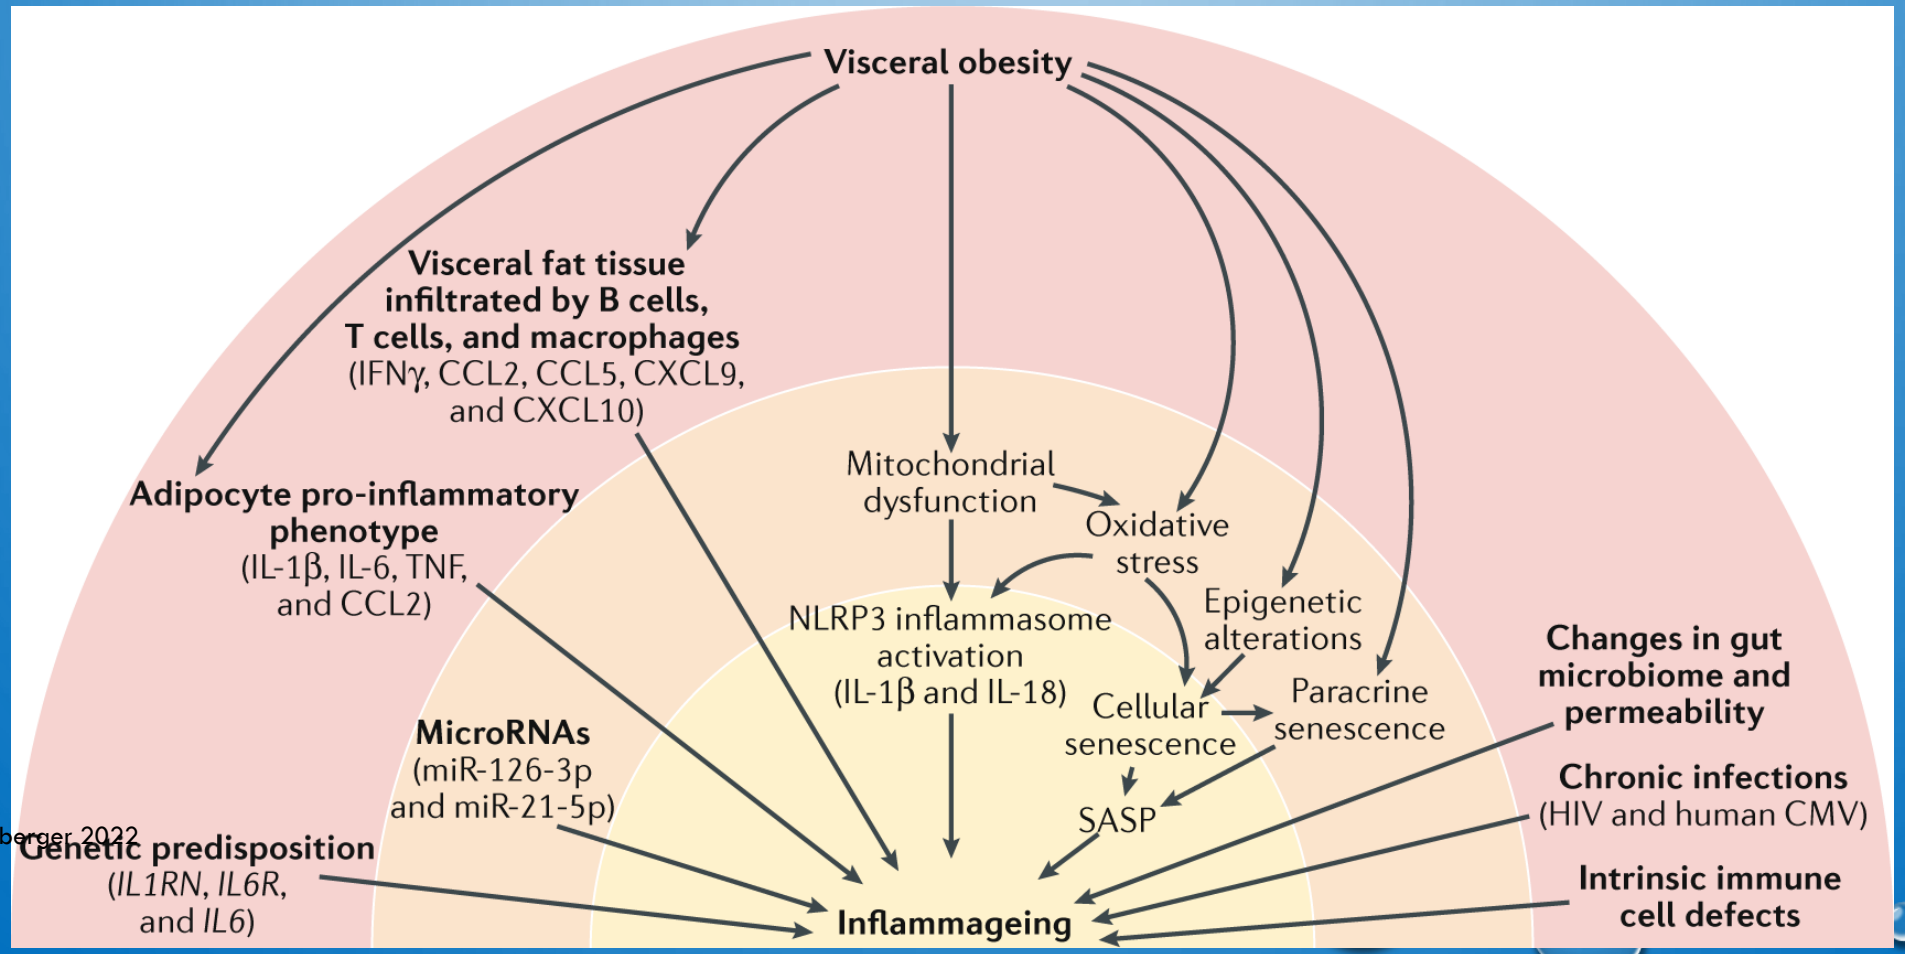
Table 1. Summary of the advantages and drawbacks of the main telomere length measurement methods

Method	Approach	Advantages	Drawbacks
Telomere Restriction Fragment (TRF)	Southern blot hybridization using probes against telomere repeats.	-Well known and widely used technique. -It has no special requirements in terms of reagents or equipment .	-Difficult to quantify. -Requires many cells (~106). -Provides and estimate of the average telomere length per sample -Subtelomeric polymorphism.
Telomere measurement by quantitative PCR	It measures the ratio of telomere repeat copy number to single copy gene copy number.	-Simple -Fast -Scalable to achieve a high throughput (HT) of samples.	-It quantifies the average telomere length per sample and cannot quantify individual telomeres.
Flow FISH	Based on the determination of telomere fluorescence in individual interphase cells using fluorescence-activated cell sorting (FACS) technology.	-Simple -Amenable to automatization, -Quantitative, reproducible, and accurate.	-Restricted to isolated cells, and cell suspensions. -Requires expensive and technical demanding system. -Not many samples (<20) are processed and analyzed at the same time. -It quantifies the average telomere length per cell.
Metaphases quantitative FISH	Based on the use of digital fluorescence microscopy to determine telomere fluorescence after hybridization of metaphase spreads with a fluorescent PNA telomeric probe.	-Permits the measurement of telomere length at each individual chromosome end. -Allows quantification of the number of "signal-free ends" (<0.15 kb) -High accuracy.	-Labor-intensive and time consuming (week/s) -Requires expensive and technical demanding system. -External calibration (from auf to kb) -Many controls required to avoid inter/intra-session variability. -Very few samples are analyzed at the same time.
Single Telomere Length Analysis (STELA)	It is a ligation PCR-based method.	-It requires no specialized equipment. - It requires very limited starting material	-It is usually restricted to several well characterized chromosome ends: XpYp, 2p, 11q and 17p. -It is limited in the analysis of long telomeres (typically >20kb). -Labor intensive and low throughput.

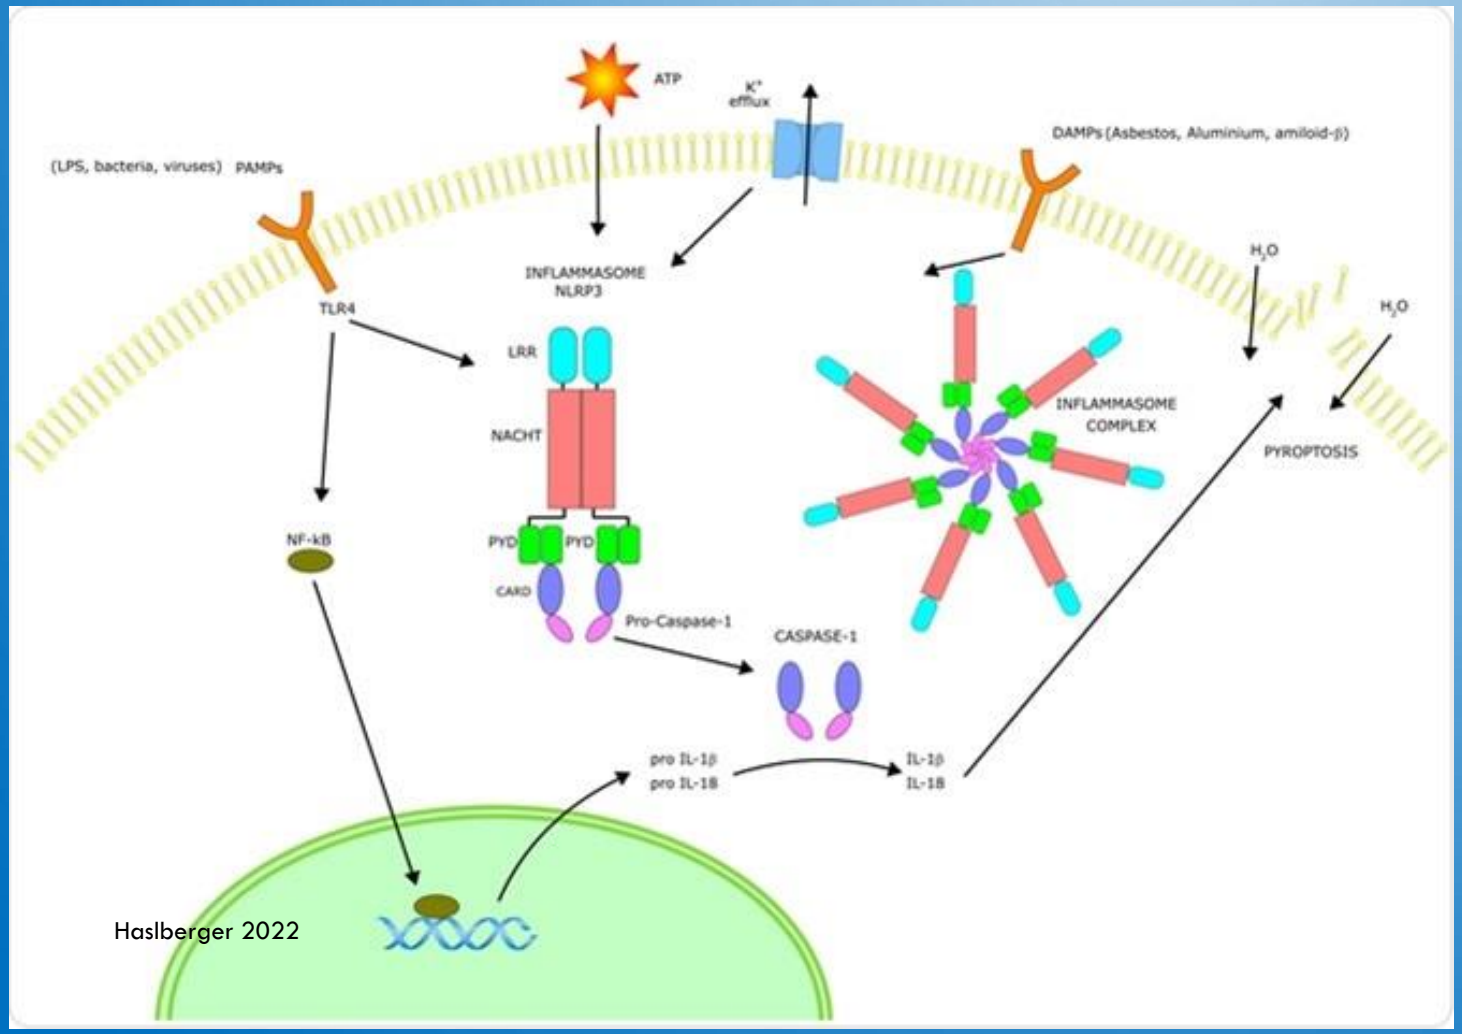
AGEING, INFLAMMATION AND DNA DAMAGE



INFLAMMAGEING: CHRONIC INFLAMMATION IN AGEING, CARDIOVASCULAR DISEASE, AND FRAILTY



INFLAMMASOME



The inflammasomes are **innate immune system receptors and sensors that regulate the activation of caspase-1 and induce inflammation in response to infectious microbes and molecules derived from host proteins**

AGING MECHANISMS AND SENESCENCE

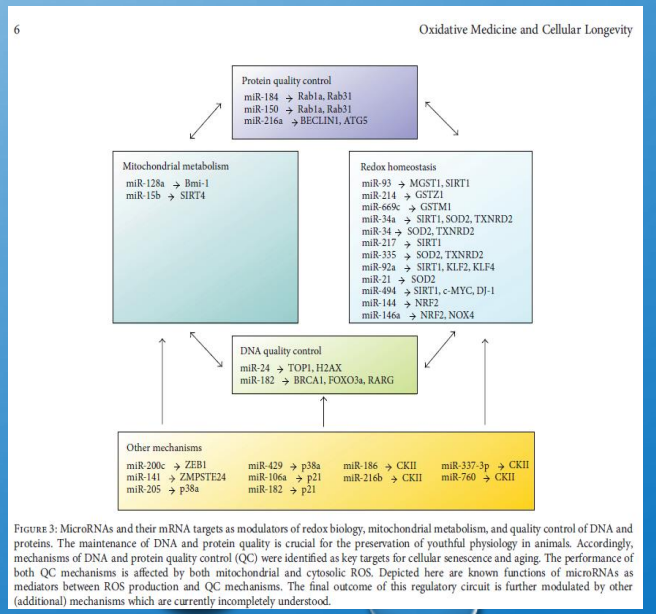

FIGURE 3: MicroRNAs and their mRNA targets as modulators of redox biology, mitochondrial metabolism, and quality control of DNA and proteins. The maintenance of DNA and protein quality is crucial for the preservation of youthful physiology in animals. Accordingly, mechanisms of DNA and protein quality control (QC) were identified as key targets for cellular senescence and aging. The performance of both QC mechanisms is affected by both mitochondrial and cytosolic ROS. Depicted here are known functions of microRNAs as mediators between ROS production and QC mechanisms. The final outcome of this regulatory circuit is further modulated by other (additional) mechanisms which are currently incompletely understood.

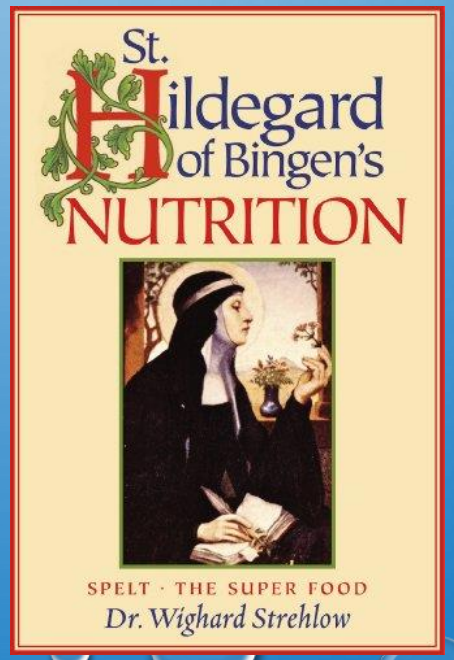
NUTRIEPIGENETICS

NUTRITION FOODS

Nutrition is the biochemical and physiological process by which an organism uses food to support its life.	Hippocrates, **"Let food be thy medicine, and let medicine be thy food"**



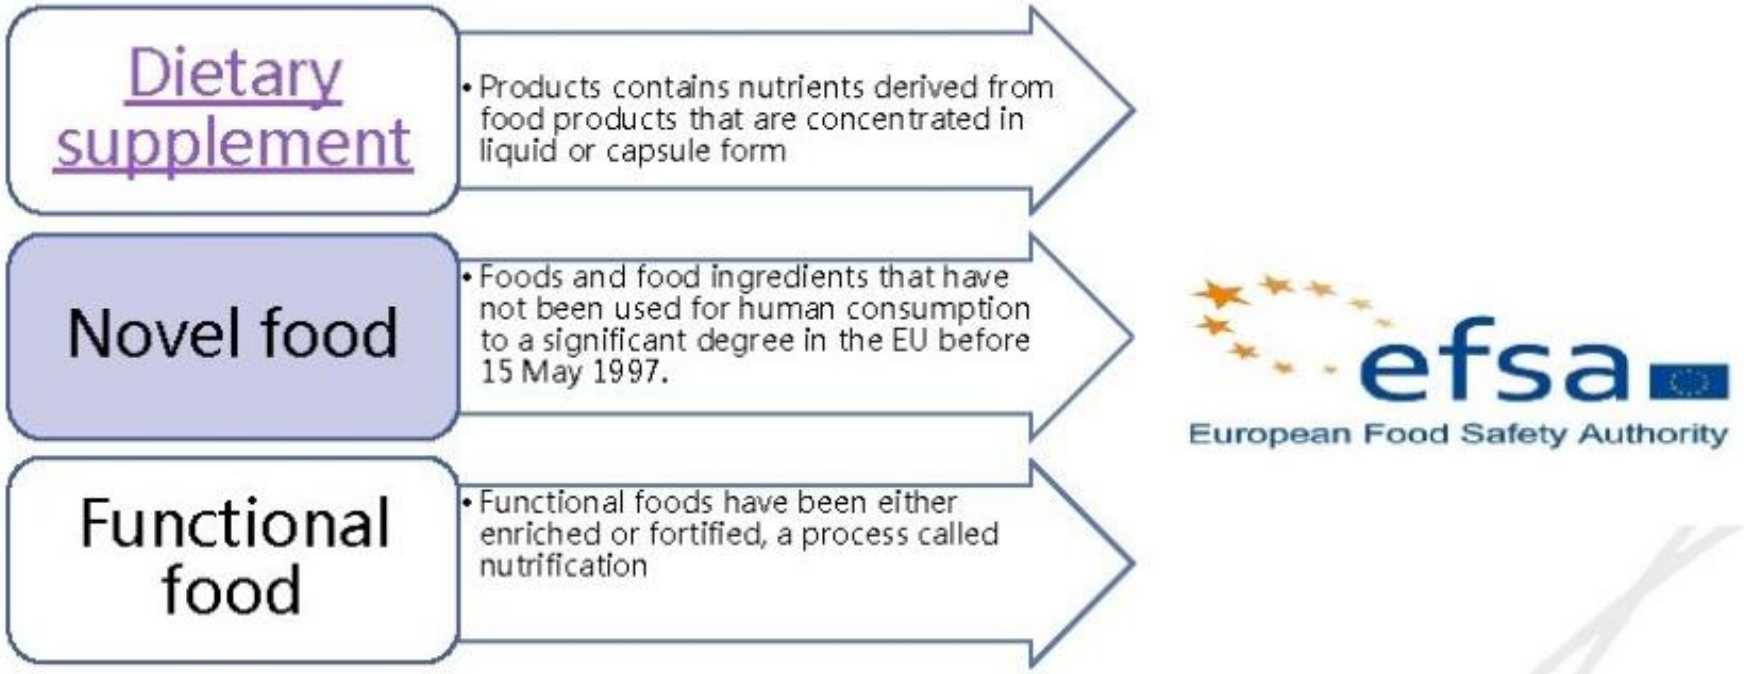
Dinkel ist das Hildegard-Getreide schlechthin.

Sie schätzte das Korn für seine warmen, kräftigen und fetten Eigenschaften. Dinkel sei zudem sehr mild und sorge für ein gutes Blut und Fleisch. Heute wissen wir, dass Dinkel eine tolle Alternative zum klassischen Weizen ist. Er gilt als robuster und weniger schadstoffbelastet im Vergleich zum konventionellen Weizen. Der Dinkelanbau ist weniger auf künstliche Dünger und Pestizide angewiesen, außerdem schützt seine besonders dicke Getreidehülse (Spelze) das Korn gut vor schädlichen Einflüssen.

Knoblauch ist laut Hildegard von Bingen roh, frisch und in Maßen zu verzehren.

Hält man sich an diese Regeln, soll die pikante Knolle das Blut erwärmen und gut für die Augen sein. Dem Knoblauch wird heutzutage auch eine besonders antibiotische und antioxidative Wirkung zugeschrieben. Also darf er doch gerne auf dem Teller landen – sollten wir es mit dem Verzehr nicht übertreiben und ihn maßvoll essen – wie Hildegard empfiehlt. Dann bleiben uns und unserem Umfeld auch die knoblauchtypischen Körperausdünstungen erspart.

EFSA



Dietary supplement
• Products contains nutrients derived from food products that are concentrated in liquid or capsule form
Novel food
• Foods and food ingredients that have not been used for human consumption to a significant degree in the EU before 15 May 1997.
Functional food
• Functional foods have been either enriched or fortified, a process called nutrification
efsa
European Food Safety Authority

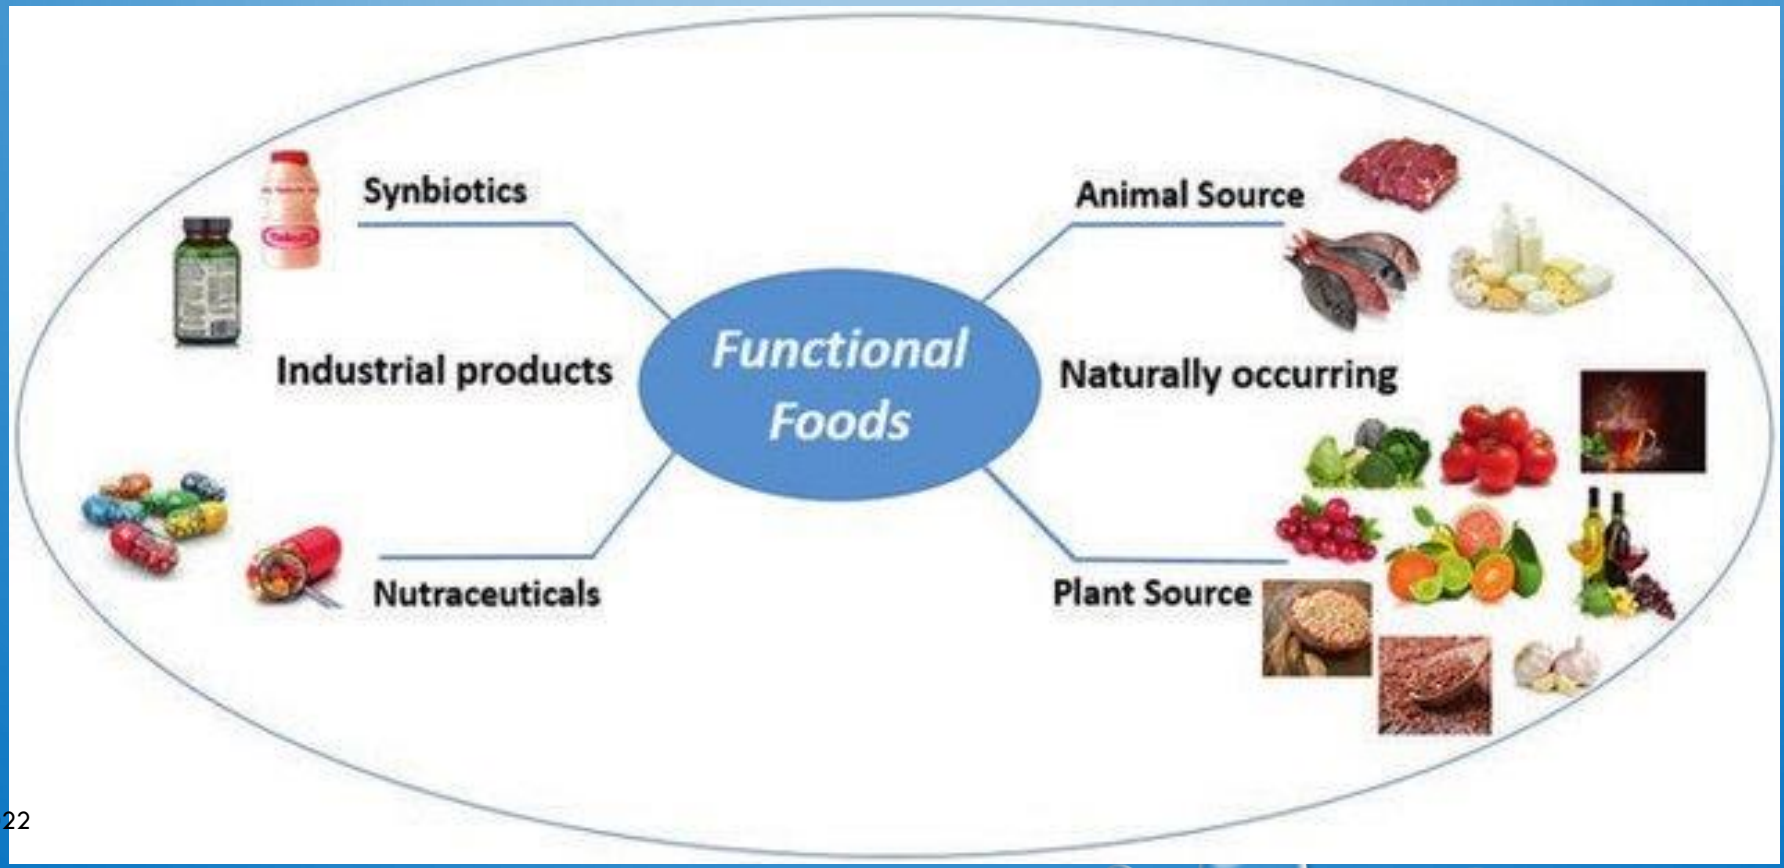
Novel food

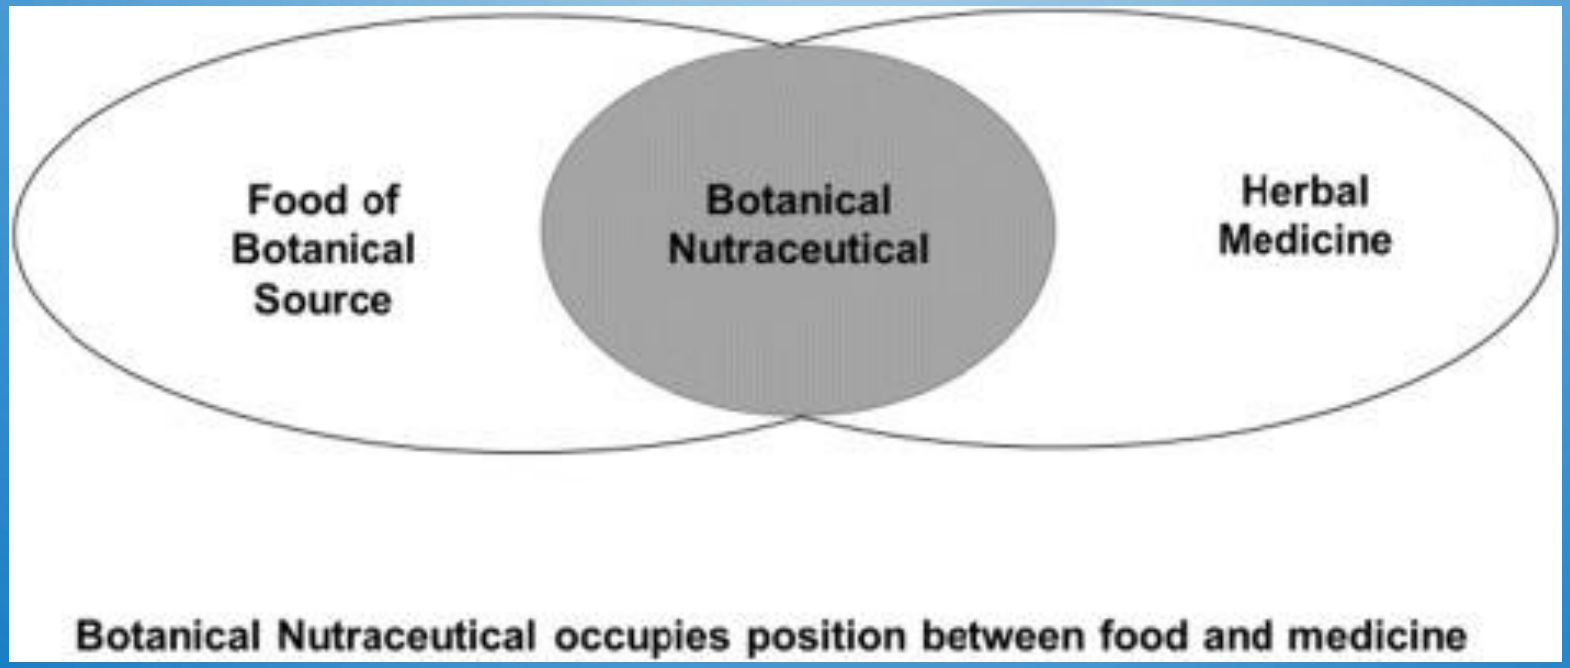
- Foods and food ingredients
  - with a new or intentionally modified primary molecular structure (eg, fat substitutes);
  - consisting of microorganisms, fungi or algae, or can be isolated from this (for example, microalgae oil);
  - consisting of plants or isolated (eg phytosterols), and isolated from animals food ingredients.

INTRODUCTION

- Functional foods are defined as “any food and food ingredients that may provide health benefit beyond the traditional nutrition that it contains”.
- **Japan** was the first country to recognize functional foods as a separate category when in **1991** it introduced the **FOSHU (Foods for Specific Health Use)** system to evaluate health claims.
- FSSAI issues Gazette notification for regulations on Nutraceuticals, Functional Foods, Novel Foods and others on 23 December 2016.

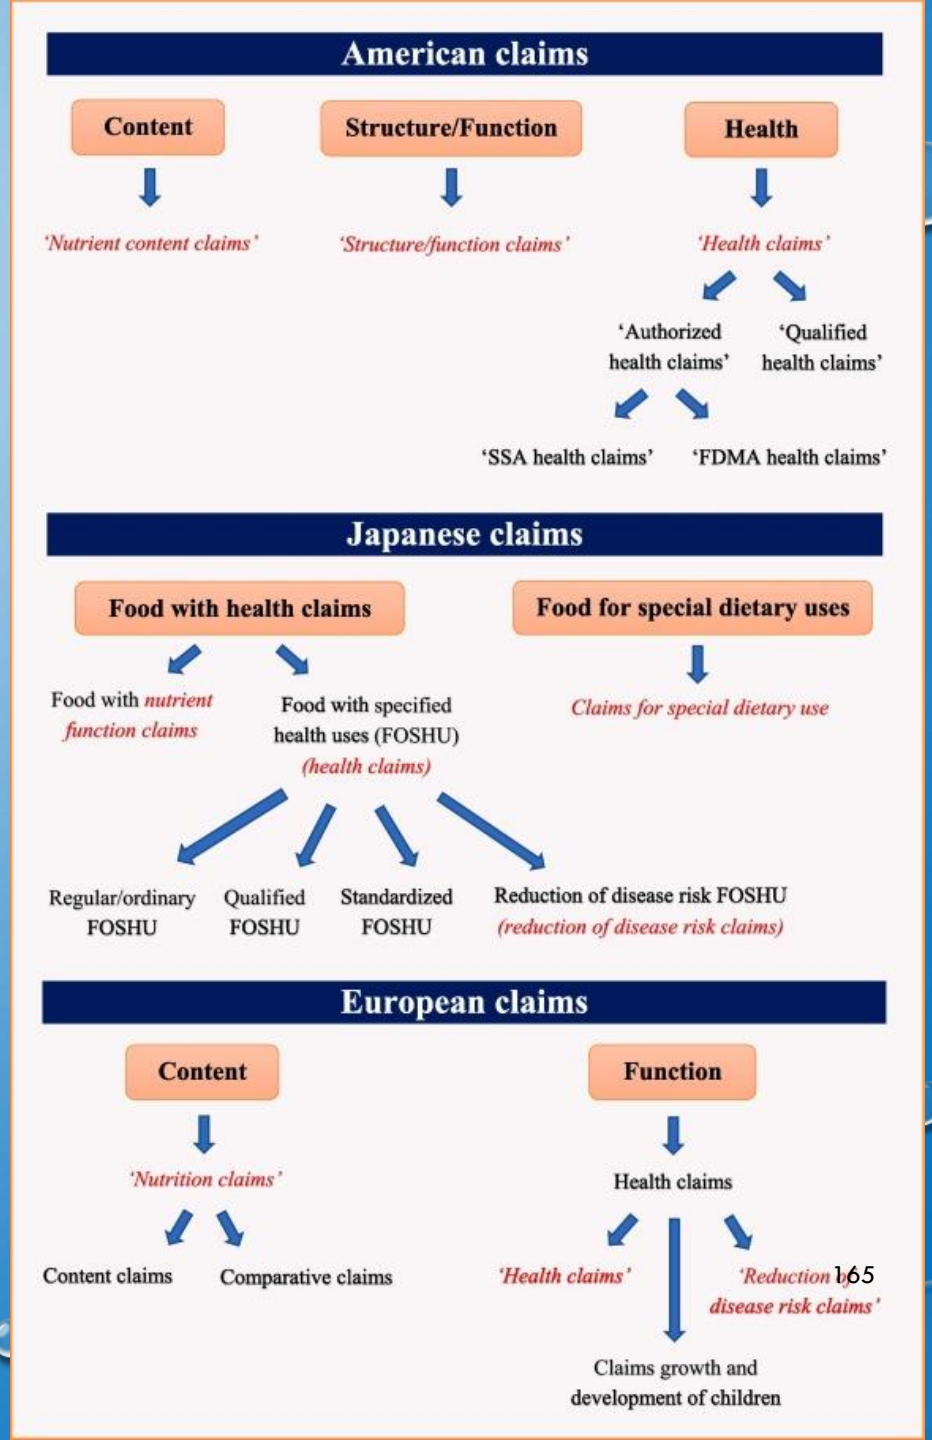
FUNCTIONAL FOOD





Botanical Nutraceutical occupies position between food and medicine

FUNCTIONAL FOODS AND HEALTH CLAIMS



EPIGENETIC DIETS FOR PREVENTION AND CO- THERAPY ?

Diet and Epigenetics

Examples of dietary ingredients with epigenetic and chromatin remodeling properties

- Sulforanes from Brassica – HDAC inhibitors
- EGCG from green tea – DNA demethylation
- Genistein from soy – DNA methylation/demethylation
- Resveratrol from red grapes – affects NAD^+- dependent histone deacetylases (i.e., SIRT1) that deacetylates histones and regulatory proteins like PGC-1α
- Lunasin from soy – chromatin binding peptide and inhibitor of histone acetylation

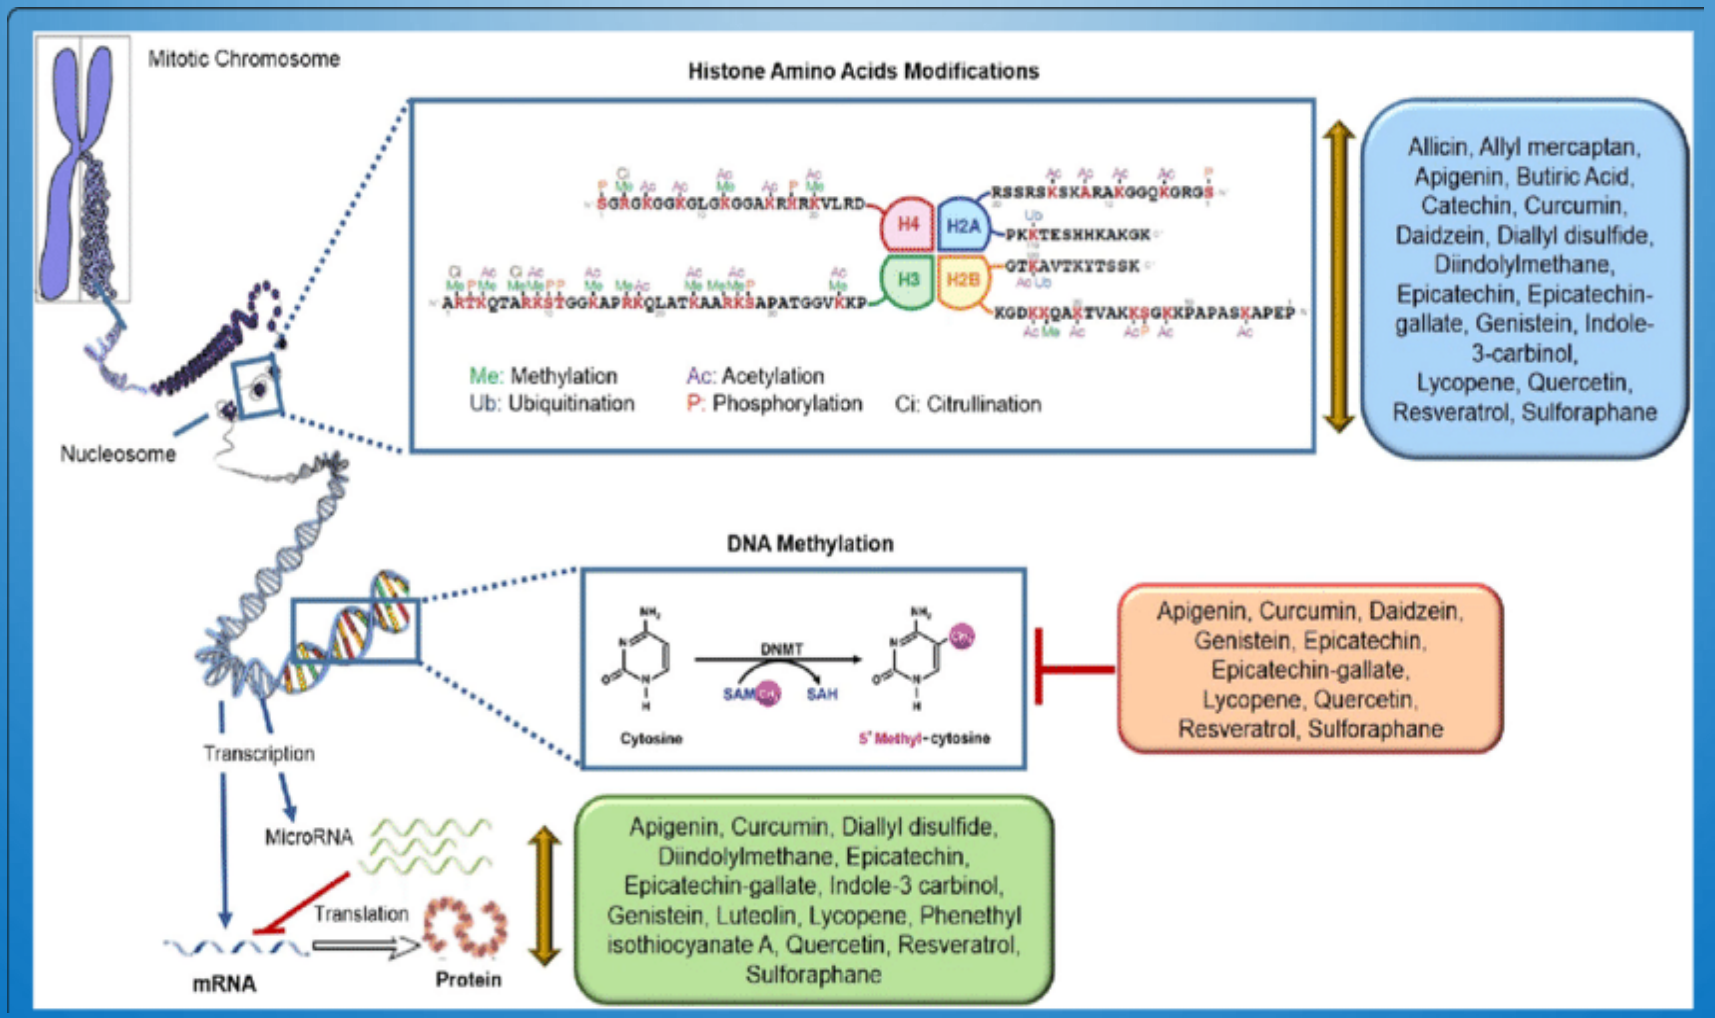
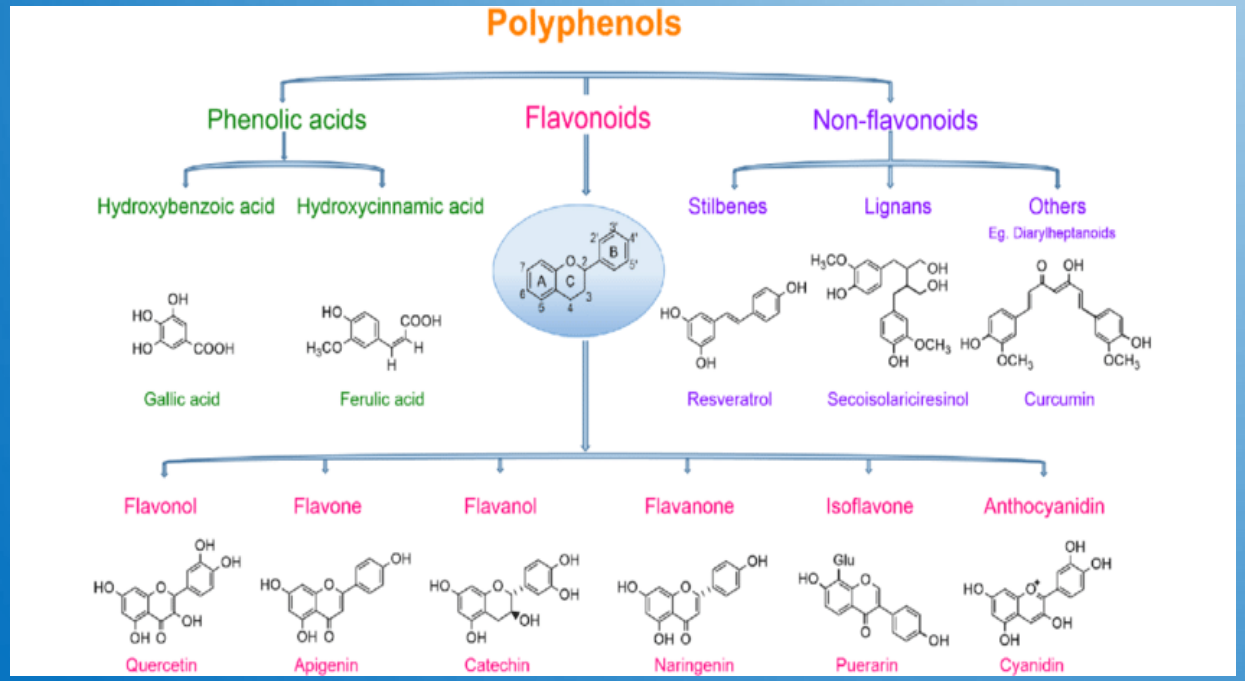
EFFECT OF PLANT INGREDIENTS ON ALL EPIGENETIC MECHANISMS



POLYPHENOLS



Polyphenols are molecules chemically characterized by the presence of at least one aromatic ring with one or more hydroxyl groups attached . Polyphenols are plant secondary metabolites that are thought to help plants to survive and proliferate, protecting them against microbial infections or herbivorous animals, or luring pollinators . Polyphenols are found in many medicinal and edible plants which represent important alimentary sources, including fruits, vegetables, beverages (such as tea and red wine) and extra virgin oil

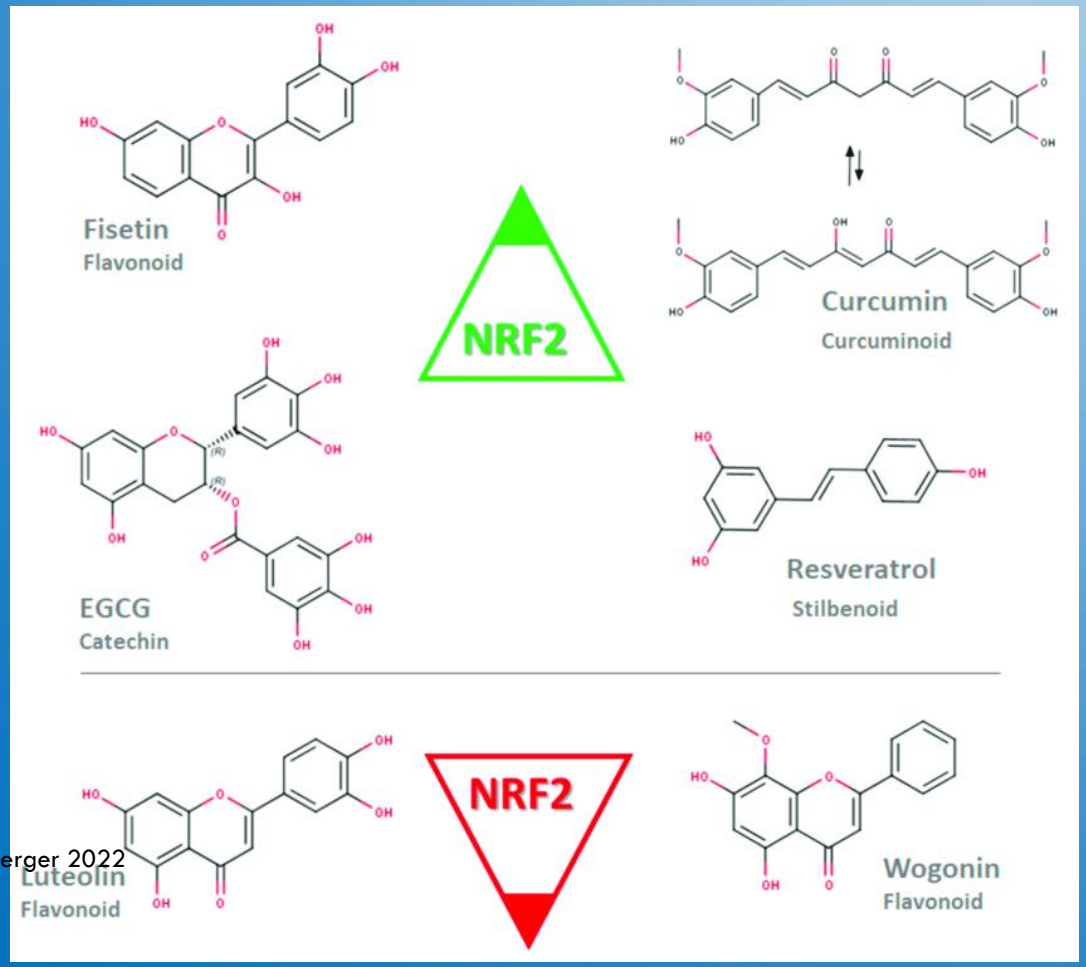
Abstract | The transcription factor NF-E2 p45-related factor 2 (NRF2; encoded by *NFE2L2*) and its principal negative regulator, the E3 ligase adaptor Kelch-like ECH-associated protein 1 (KEAP1), are critical in the maintenance of redox, metabolic and protein homeostasis, as well as the regulation of inflammation. Thus, NRF2 activation provides cytoprotection against numerous pathologies including chronic diseases of the lung and liver; autoimmune, neurodegenerative and metabolic disorders; and cancer initiation. One NRF2 activator has received clinical approval and several electrophilic modifiers of the cysteine-based sensor KEAP1 and inhibitors of its interaction with NRF2 are now in clinical development. However, challenges regarding target

NRF2 AGONISTS, ANTIAGONISTS



NRF2 (or NFE2L2) is a protein, naturally found within the body. It's job is **to help regulate the work of antioxidant proteins that can help protect against oxidative damage**.

This oxidative damage can be triggered by injury and inflammation and involves the production of free radicals.

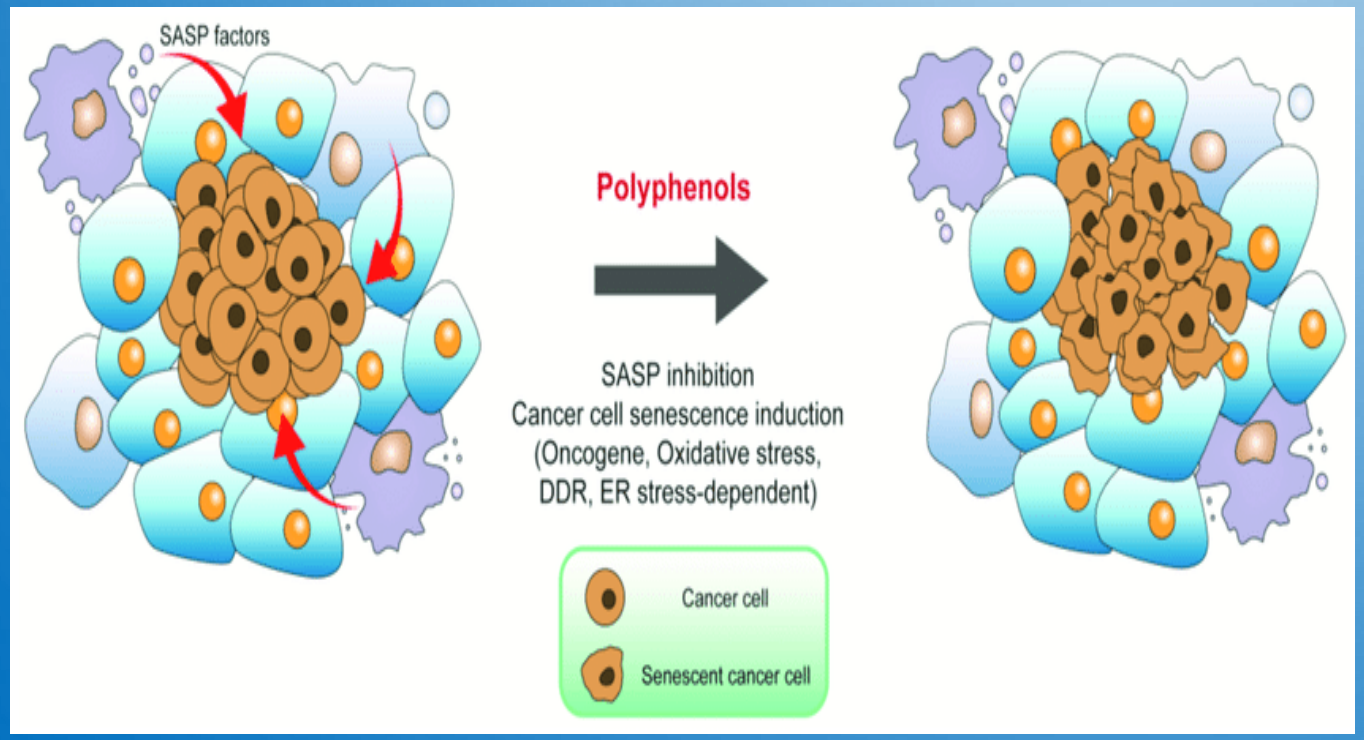
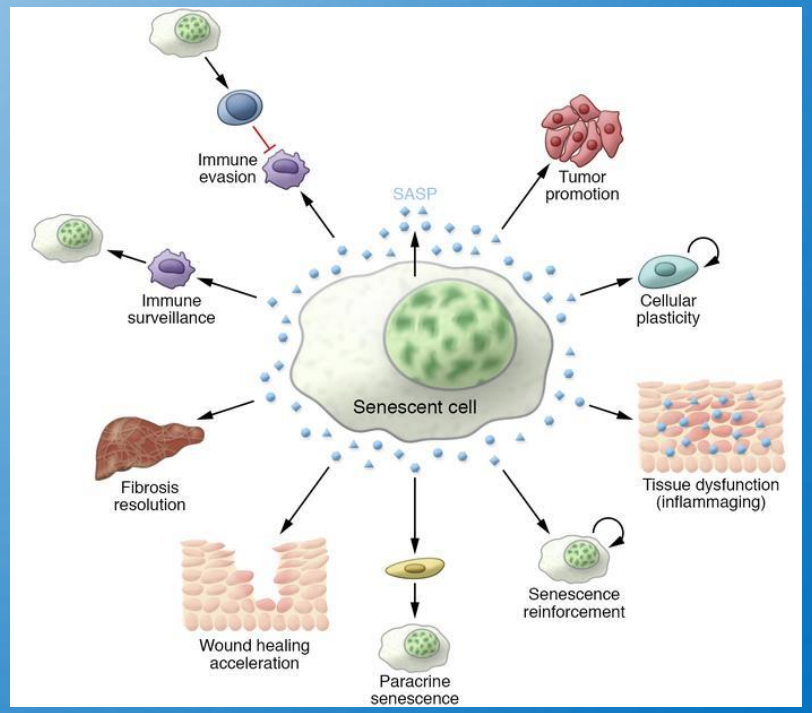
POLYPHENOLS, AGING SENESCENCE





SENESCENCE AND POLYPHENOLS

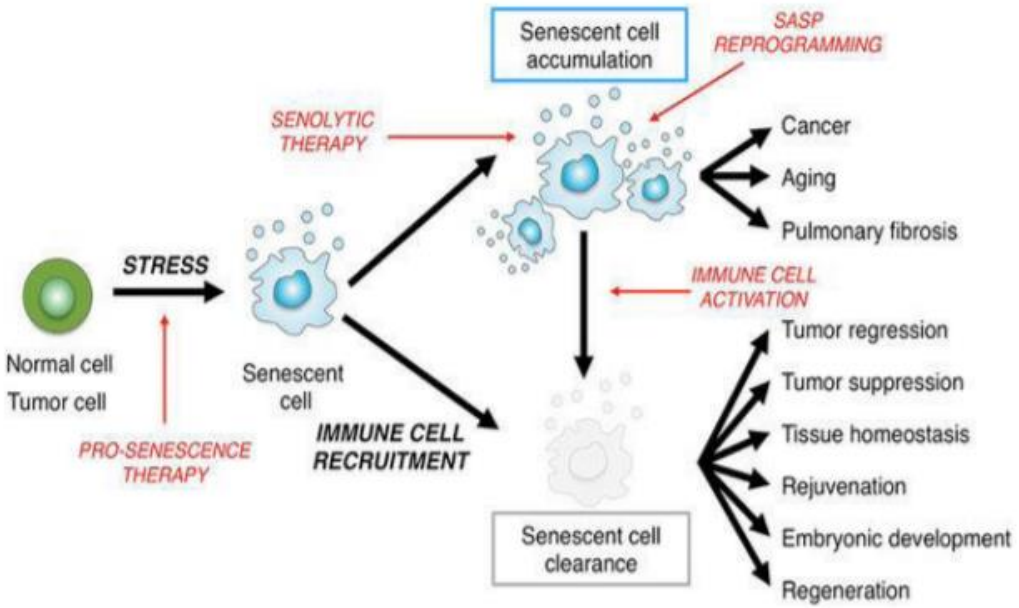


Figure 16. Clearance of senescent cells and therapeutic options. Cellular senescence is more than an anti-proliferative program. Senescent cells secrete factors that constitute the senescence-associated secretory phenotype (SASP). Cellular senescence is followed by senescent cell clearance within those processes that are considered beneficial. However, if the elimination of senescent cells does not occur, senescent cells accumulate and can lead to cancer and aging. Different therapeutic strategies (in red) could be used to exploit the beneficial aspects of cellular senescence and repress the negative ones [150].

Abstract: Cancer is one of the most serious diseases endangering human health. In view of the side effects caused by chemotherapy and radiotherapy, it is necessary to develop low-toxic anti-cancer compounds. Polyphenols are natural compounds with anti-cancer properties and their application is a considerable choice. Pro-senescence therapy is a recently proposed anti-cancer strategy and has been shown to effectively inhibit cancer. It is of great significance to clarify the mechanisms of polyphenols on tumor suppression by inducing senescence. In this review, we delineated the characteristics of

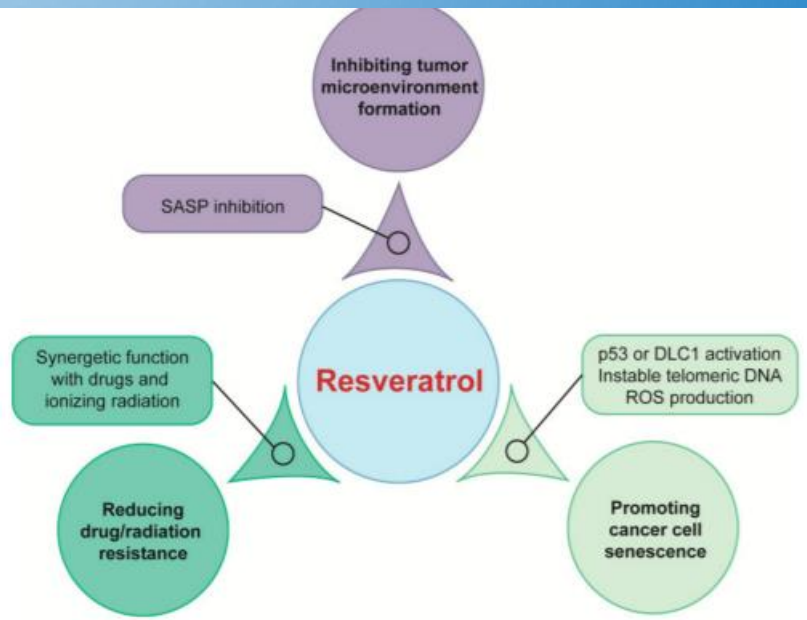

Figure 2. Potential functions of resveratrol in anti-tumor therapy. Resveratrol inhibit tumor microenvironment for cancer prevention, reduce drug/radiation resistance and induce cancer cell senescence for cancer therapy. SASP, senescence-associated secretory phenotype; DLC1, deleted in liver cancer1; ROS, reactive oxygen species.

Exercise Prevents Diet-Induced Cellular Senescence in Adipose Tissue

Diabetes 2016;65:1606–1615 | DOI: 10.2337/db15-0291

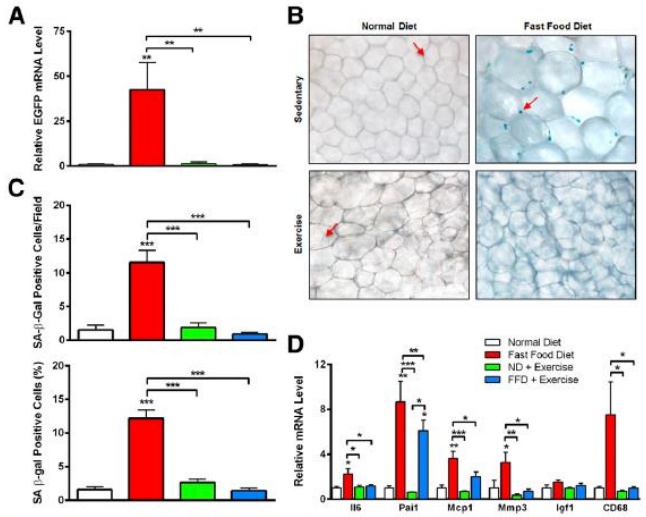

Figure 4—Exercise prevents diet-induced cellular senescence and the SASP within visceral adipose tissue. *A*: Compared with the ND, the FFD caused a marked increase in the activity of the senescence-associated $p16^{INK4a}$ promoter, as measured by EGFP expression. *B*: Representative images show the abundance of cells positive for SA-β-gal (arrow) in harvested visceral adipose tissue further validated the pro- and antisenescent effects of nutrient excess and exercise, respectively (summary data, *C*). *D*: The expression of SASP and inflammatory factors was also increased in response to FFD, and these increases were attenuated by exercise. For all analyses, $n = 6–7$ mice/group. $^*P < 0.05$, $^{**}P < 0.01$, $^{***}P < 0.001$.

Table 1
Different families and type of viruses, their specific virus and the role of polyphenols as a possible alternative to treat virus.

Type of virus	Specific virus	Disease characteristics	Conventional treatment	Alternative treatment with polyphenols	Reference
Respiratory infections	Influenza virus (A, B and C)	Annually responsible for high mortality in both humans and animals worldwide	NA inhibitors and M2 protein channel blockers after infection, while vaccination is the most effective therapy	1,2,3,4,6-Penta-O-galloyl-ß-D-glucose (IC_{50} of 2.36 μg/mL) purified from *Echinacea purpurea*, *Phyllanthus emblica* Linn inhibits virus replication	(Fox and Christenson, 2014; Liu et al., 2011; Moscona, 2008)
	Coronavirus (HCoV-229E, HCoV-OC43, HCoV-NL63, HCoV-HKU1, severe acute respiratory syndrome coronavirus (SARS-CoV), Middle East respiratory syndrome coronavirus (MERS-CoV) and the novel SARS-CoV-2)	Respiratory tract infections in humans with outbreaks around the world, especially in winter	Currently there are no specific treatments for the CoV infection and preventive vaccines are being developed	Polyphenol extract from *Echinacea purpurea* against SARS-CoV-2 provided 50% of inhibition Kaempferol and quercetin from *Broussonetia papyrifera* against MERS-CoV and SARS-CoV effectively inhibited with an IC_{50} of 27.9 μM and 30.2 μM, respectively	(Chiow et al., 2016; Liu et al., 2020; Park et al., 2017; Signer et al., 2020)
	Rhinovirus	The main cause of the common cold, among other respiratory diseases, also producing shortness of breath in asthmatic people, acute otitis and bronchiolitis	There are no vaccines or antiviral agents for the prevention or treatment of this virus	Resveratrol showed a therapeutic approach to reduce infection when the IC_{50} was 50 μM Gallic acid, extracted (100 μg/mL) from *Woodfordia fruticose* flowers, reported 55% virus inhibition	(Choi et al., 2010; Mastromarino et al., 2015; Ruuskanen et al., 2013)
	Syncytial virus	Causes infections in infants and the elderly, causing not only acute morbidity but also recurrent breathing problems	There is no safe and effective treatment Corticosteroids was treated children of preschool-age who had early bronchitis, but the results were not satisfactory and failed to reduce the infection or breathing problems	Resveratrol (IC_{50} 189 pg/mL) inhibits 40% virus replication and down-regulates the TIR-domain-containing adapter-inducing interferon-β (TRIF) complex, which sends signals for the activation of innate immune cells	(Beigelman et al., 2014; Tagarro et al., 2014; Xie et al., 2012)
Gastrointestinal infections	Rotavirus	Causes dehydrating gastroenteritis, especially in children under five years of age	There is a vaccine against rotavirus but annually the mortality is around 200,000 deaths worldwide. The treatment focuses on dehydration and not on the use of antiviral agents	Polyphenols (licocoumarone, glycyrin, among others) extracted from *Glycyrrhiza uralensis* root (EC_{50} 18.7–69.5 μM) can inhibit 50% virus absorption and replication after the cell's entry	(Crawford et al., 2017; Cushnie and Lamb, 2005; Kwon et al., 2010)
Hepatic infections	Hepatitis virus (A, B and C)	Cause high morbidity and mortality around the world	Anti-hepatitis virus drugs are members of nucleotides or nucleoside analogs, which inhibit the activity of polymerase or reverse transcriptase, but the prolonged use giving rise to the existence of mutant viruses	Curcumin (150 μM) inhibits hepatitis B virus	(Mouler Rechtman et al., 2010; Sukowati et al., 2016; Yugo et al., 2016)
	Epstein–Barr virus	Infects human epithelial and lymphoid cells. Infection is associated with a number of human cancers, such as Hodgkin's disease	A vaccine is not yet approved	(−)-Epigallocatechin gallate (EGCG) extracted from green tea (50 μM) blocked the EBV lytic cycle, inhibiting the transcription of immediate-early genes in a range of 40–50%	(Abba et al., 2015; Chang et al., 2003; Cohen, 2018)
	Human cytomegalovirus	Not present obvious symptoms, but infection causes morbidity and mortality in transplant recipients or patients with acquired immunodeficiency syndrome (AIDS)	Drugs such as cidofovir, valganciclovir and ganciclovir, which target viral DNA polymerase, but their side-effects include long-term toxicity, low bioavailability, plus drug resistance to the virus	Curcumin, using a low dose of 0.2 μg/mL, inhibits virus protein expression	(Ahmed, 2012; Evers et al., 2005; Lv et al., 2014)
	Herpes simplex virus (HSV-1 and HSV-2)	Responsible for orolabial and genital diseases producing, in general, benign lesions but, in some cases, putting the life of patients at risk if the infections are recurrent	There is no vaccine and existing drugs (e.g., acyclovir) do not eradicate the virus infection and cause resistance to drugs	Ent-epiafzelechin-(4α→8)-epiafzelechin extracted from *Cassia javanica* leaves (250 μM of) inhibits more than 90% of HSV-2 penetration to the host cell	(Cheng et al., 2006; Morfin and Thou, 2003; Piret and Boivin, 2011)
Exanthematous infections	Varicella-zoster virus	Causes fever and vesicular rash. Once the disease has disappeared, the virus enters into a state of latency, but it can be reactivated due to stress, causing herpes	Generally, uses drugs such as acyclovir, valacidovir, etc., which are often combined with analgesics for pain and corticosteroids for inflammation	Resveratrol (219 μM of) inhibits 100% virus replication	(Docherty et al., 2006; Johnson and Whitton, 2004)

Quercetin as an Antiviral Agent Inhibits Influenza A Virus (IAV) Entry

Wenjiao Wu [1], Richan Li [1], Xianglian Li [1], Jian He [1], Shibo Jiang [2,3], Shuwen Liu [1,*] and Jie Yang [1,2,*]

Received: 10 October 2015; Accepted: 30 November 2015; Published: 25 December 2015
Academic Editor: Curt Hagedorn

Abstract: Influenza A viruses (IAVs) cause seasonal pandemics and epidemics with high morbidity and mortality, which calls for effective anti-IAV agents. The glycoprotein hemagglutinin of influenza virus plays a crucial role in the initial stage of virus infection, making it a potential target for anti-influenza therapeutics development. Here we found that quercetin inhibited influenza infection with a wide spectrum of strains, including A/Puerto Rico/8/34 (H1N1), A/FM-1/47/1 (H1N1), and A/Aichi/2/68 (H3N2) with half maximal inhibitory concentration (IC_{50}) of 7.756 ± 1.097, 6.225 ± 0.467, and 2.738 ± 1.931 μg/mL, respectively. Mechanism studies identified that quercetin showed interaction with the HA2 subunit. Moreover, quercetin could inhibit the entry of the H5N1 virus using the pseudovirus-based drug screening system. This study indicates that quercetin showing inhibitory activity in the early stage of influenza infection provides a future therapeutic option to develop effective, safe and affordable natural products for the treatment and prophylaxis of IAV infections.

Anti-influenza virus activity of EGCg

Data of Professor Kurokawa's study group at Kyushu University of Health and Welfare

Virus	EC50, ppm (Effective conc. for 50% plaque reduction)			
	①Virus+EGCg →Cells	② Virus+Solvent →Cells	③EGCg+Cells →Virus	④ Virus+Cells →EGCg
Influenza virus type A				
Bangkok/93/03(H1N1)	1.41±0.17	>30	>30	19.3±1.8
PR8/8/34(H1N1)	2.19±0.09	>30	>30	>30
Aichi/2/68(H3N2)	2.76±0.23	>30	>30	22.9±1.4
Influenza virus type B				
Singapore	0.93±0.35	>30	>30	11.1±1.6

CC50 value (cytotoxic conc. for 50% reduction of cell growth) of EGCg was 85.6 ppm.

Summary of Methods and Results

①EGCg-treated virus was adsorbed to cells.
EGCg was significantly effective in inhibiting the adsorption and/or invasion of influenza virus type A and B to cells. EC50 values of EGCg were 31 to 92-folds lower thatn the CC50 value.

②Solvent-treated virus was adsorbed to cells. Components of solvent except EGCg did not show any anti-influenza virus activity

③Virus was adsorbed and infected to EGCg-treated cells.
EGCg was not effective in interfering with virus adsorption and/or invasion in EGCg-pretreated cells.

④Virus-adsorbed and infected cells were incubated in the presence of EGCg.
Progeny virus probably contacted with EGCg contained in medium and the adsorption and/or invasion into cells were interrupted.

Abstract

Background: As the COVID-19 pandemic rages on, the new SARS-CoV-2 variants have emerged in the different regions of the world. These newly emerged variants have mutations in their spike (S) protein that may confer resistance to vaccine-elicited immunity and existing neutralizing antibody therapeutics. Therefore, there is still an urgent need of safe, effective, and affordable agents for prevention/treatment of SARS-CoV-2 and its variant infection.

Results: We demonstrated that green tea beverage (GTB) or its major ingredient, epigallocatechin gallate (EGCG), were highly effective in inhibiting infection of live SARS-CoV-2 and human coronavirus (HCoV OC43). In addition, infection of the pseudoviruses with spikes of the new variants (UK-B.1.1.7, SA-B.1.351, and CA-B.1.429) was efficiently blocked by GTB or EGCG. Among the 4 active green tea catechins at noncytotoxic doses, EGCG was the most potent in the action against the viruses. The highest inhibitory activity was observed when the viruses or the cells were pre-incubated with EGCG prior to the infection. Mechanistic studies revealed that EGCG blocked infection at the entry step through interfering with the engagement of the receptor binding domain (RBD) of the viral spikes to angiotensin-converting enzyme 2 (ACE2) receptor of the host cells.

Conclusions: These data support further clinical evaluation and development of EGCG as a novel, safe, and cost-effective natural product for prevention/treatment of SARS-CoV-2 transmission and infection.

Abstract

(-)-Epigallocatechin-3-gallate (EGCG), from green tea (Camellia sinensis), has demonstrated chemopreventive activity in animal models of carcinogenesis. Previously, we reported the bioavailability of EGCG in rats (1.6%) and mice (26.5%). Here, we report that cotreatment with a second dietary component, piperine (from black pepper), enhanced the bioavailability of EGCG in mice. Intragastric coadministration of 163.8 micromol/kg EGCG and 70.2 micromol/kg piperine to male CF-1 mice increased the plasma C(max) and area under the curve (AUC) by 1.3-fold compared to mice treated with EGCG only. Piperine appeared to increase EGCG bioavailability by inhibiting glucuronidation and gastrointestinal transit. Piperine (100 micromol/L) inhibited EGCG glucuronidation in mouse small intestine (by 40%) but not in hepatic microsomes. Piperine (20

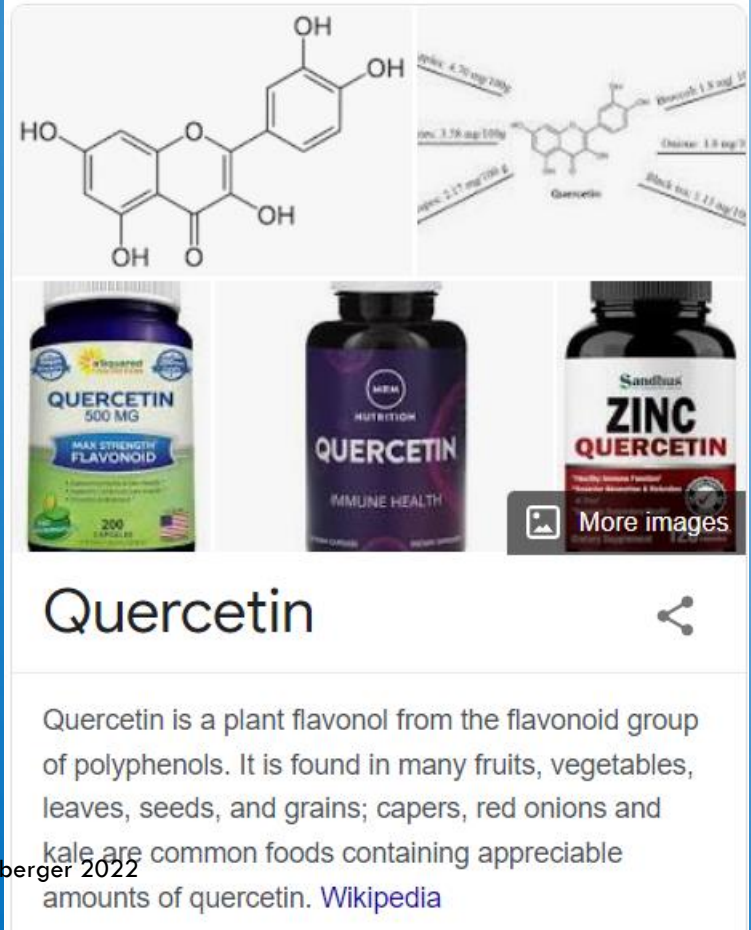
QUERCETIN



Quercetin Benefits	Additional Information
Anti-inflammatory and Immune Boosting Research has shown that quercetin displays anti-inflammatory and immune strengthening capabilities. One study even shows how quercetin was able to mitigate the inflammatory responses stimulated by the popular food additive carrageenan. Quercetin was also shown to be able to decrease the clinical indicators of arthritis.	**Recommended daily intake** • 200-250 mg/day or even lower. • Research shows that even small amounts are effective for everyday consumption.
Possible Cancer fighting properties Studies have shown that quercetin was able to restrain the growth of cancer and as such prevent the proliferation of cancer cells especially as it relates to certain types of cancers – colorectal, ovarian and breast cancer cells.	**Some foods that are high in quercetin** • Onions • Shallots • Asparagus • Green peppers • Tomatoes • Apples • Cranberries
Cardiovascular Health Research shows that quercetin was able to reduce some of the major risks factors of heart disease such as high blood pressure, oxidative stress and inflammation.	
Anti-viral properties Studies have shown that quercetin was effective in the prevention of viral or respiratory conditions as well as well as fight against viruses such as herpes and parainfluenza type 3. **Asthma** Research shows that quercetin is able to reduce inflammatory cells of the immune system as well as decrease the histamine levels which then helps to smooth the muscles of the airways and helps with breathing.	**Possible side effects** • Headaches • Stomach discomfort • Kidney damage (high doses).

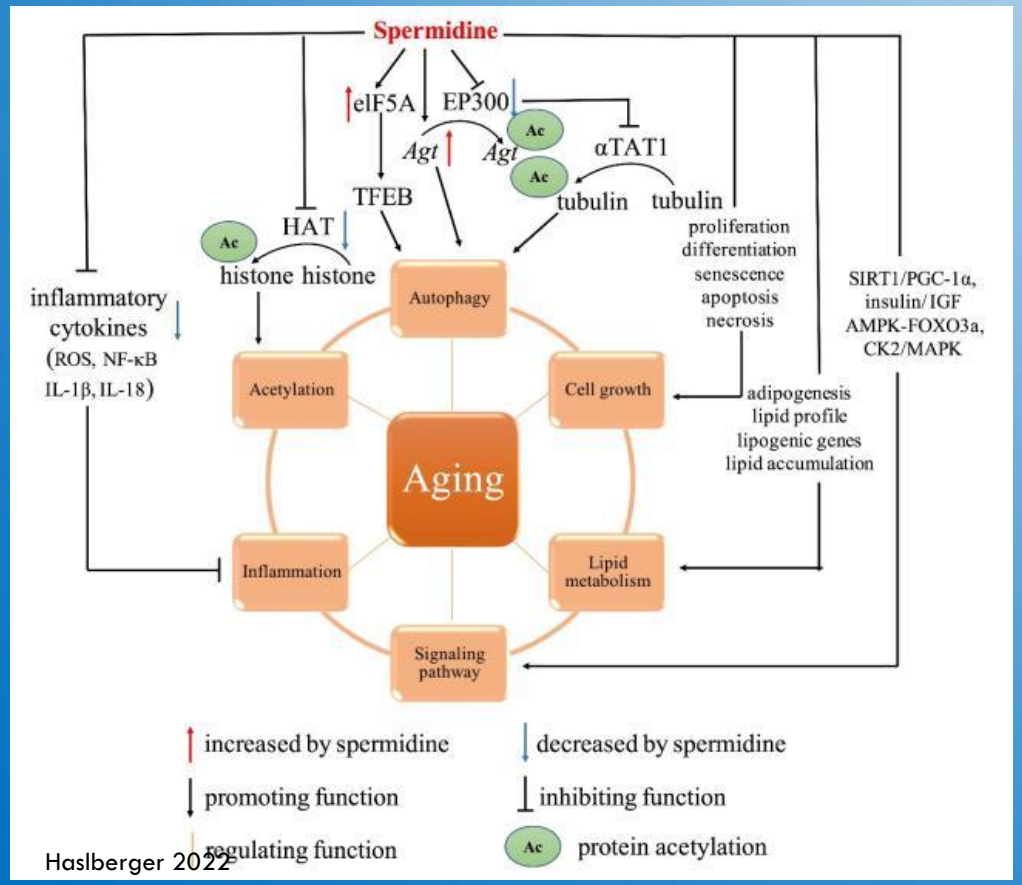
SPERMIDINE MECHANISMS



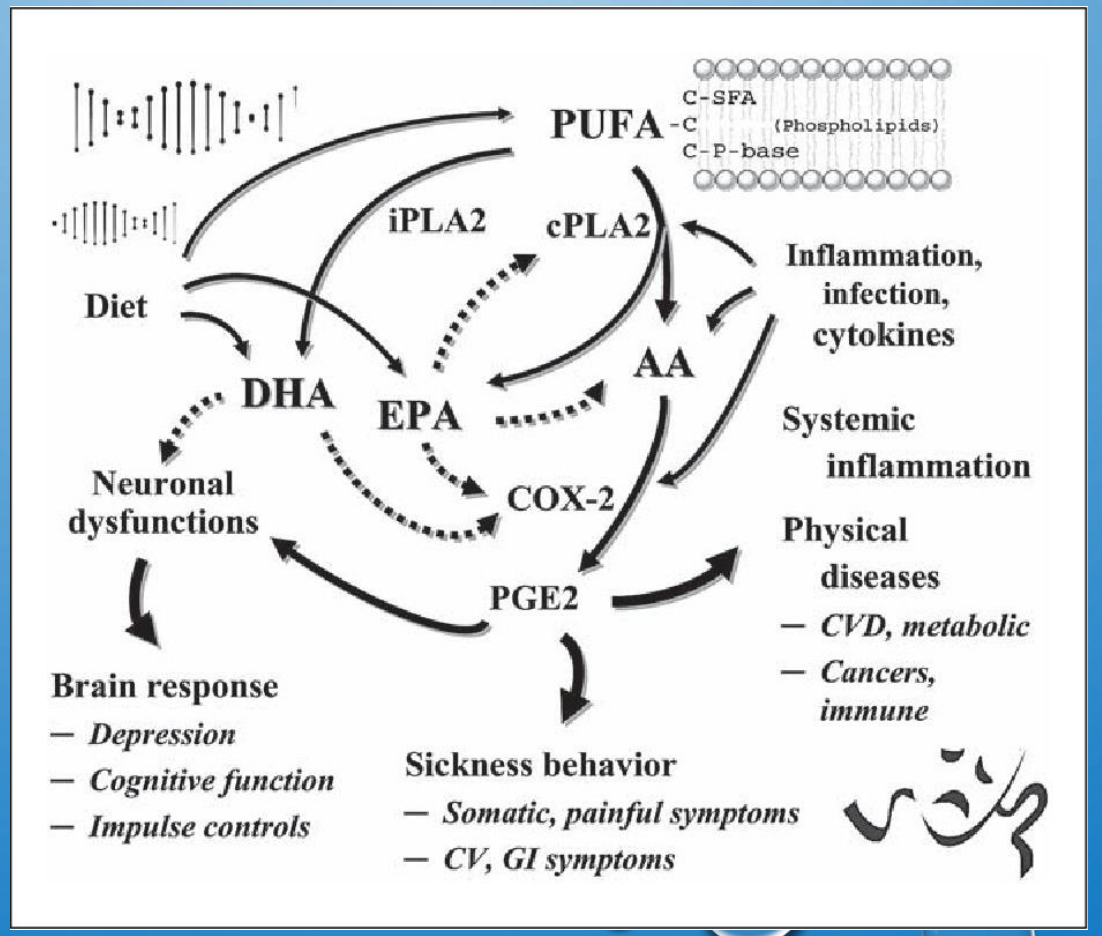
Molecular and cellular mechanisms of spermidine in age-related disease s. Spermidine is an inducer of autophagy, which is the main mechanism of anti-aging. First, spermidine **triggers autophagy by modulating the exp ressions of *Atg* genes**. Second, it regulates **transcription factor eIF5A t o promote the synthesis of transcription factor TFEB.** Third, spermidine **inhibits EP300, which directly promotes the acetylation of Atg genes** and **indirectly stimulates deacetylation of tubulin due to inhibition of αTAT1**. Besides, spermidine exerts potent anti-inflammatory roles by **sup pressing of multiple inflammatory cytokines, such as ROS, NF-κB, IL-1β and IL-18**. Moreover, it is involved in regulation **of cell proliferation, differentiation, senescence, apoptosis and necrosis**, ultimately promoti ng cell growth and inhibiting cell death.

As an anti-aging agent, spermidine suppresses histone acetylation. More over, spermidine regulates lipid metabolism. On the one hand, it promote s the differentiation of preadipocytes into mature adipocytes. On the oth er hand, it alters lipid profile, modulates lipogenic gene expressions, and represses lipid accumulation. Furthermore, spermidine can delay aging th rough specific signaling pathways, such as SIRT1/PGC-1α, insulin/IGF, A MPK-FOXO3a, and CK2/MAPK signaling pathways.

FISHOIL, EPA, DHA

Fish oil

Fish oil is oil derived from the tissues of oily fish. Fish oils contain the omega-3 fatty acids eicosapentaenoic acid and docosahexaenoic acid, precursors of certain eicosanoids that are known to reduce inflammation in the body and improve hypertriglyceridemia. Wikipedia

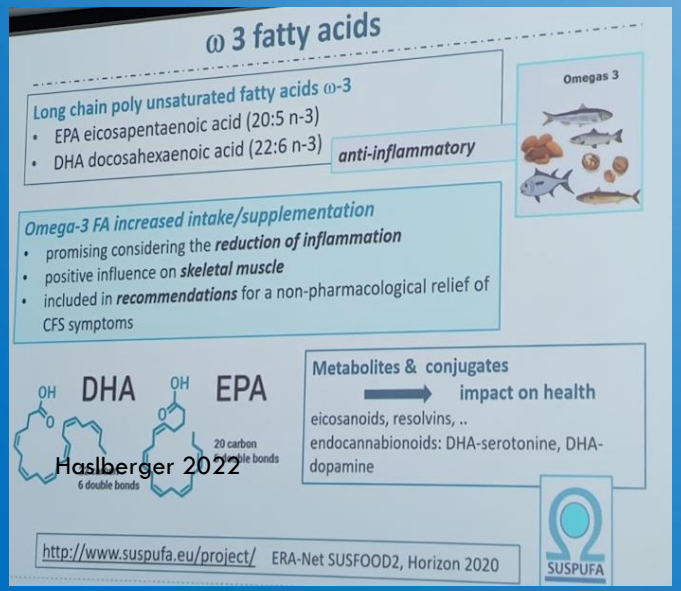


Conclusion

- Quite less ambiguity persists about a true place for marine ω3 to prevent IR
- In healthy humans, 1.8 g/d modestly increase insulin sensitivity
- But 850 mg/d aggravate dexamethasone-induced IR
- The most recent and complete meta-analysis conclude to their preventive effect towards IR
- 4 Meta-analysis conclude to a protective effect in Asian but potentially deleterious in Western populations towards the risk of T2D, probably due to the heterogeneity of western studies and a high n-6/n-3 ratio in western populations

Marine ω3 are certainly useful useful if given early and throughout life cycle, probably at least > 1g/d in adults AND in combination with exercise and maintenance of normal weight.

Personalized dosage should also be considered, which requires further studies



Marine ω3 increase insulin sensitivity in people with metabolic disorders

ABSTRACT Interindividual differences in metabolism of the soy isoflavone, daidzein, to equol and O-desmethylangolensin (ODMA) by human gut bacteria, have been associated with altered risk of cancer and other chronic diseases, according to some studies. Differences have been reported in the prevalence of the equol-producer phenotype among populations, with a higher prevalence in soy-consuming Asian populations than in Western populations. To date, prevalence of the daidzein-metabolizing phenotypes in Asians, compared with Caucasians, has not been evaluated in the context of a standardized phenotyping method. We assessed the prevalence of equol- and ODMA-producer phenotypes in 91 Korean American (KA) women and girls living in the Seattle, Washington area and compared this with previous similarly collected prevalence data in Caucasian American (CA) women and girls (n = 222). We also compared the dietary habits of the 2 groups. Isoflavonoid concentrations in first-void morning urines, collected after a 3-d soy challenge, were used to establish equol-, and ODMA-producer phenotypes (>44 μg/L). The prevalence of the equol-producer phenotype was higher (51 vs. 36%; $P = 0.015$) and the ODMA-producer phenotype was lower (84 vs. 92%, $P = 0.03$) in KA than in CA women and girls. KAs consumed approximately 3 times more soy foods than the CAs, but no significant associations were found between the consumption of soy foods and equol-producer phenotype. Our findings support the reports that, compared with Western populations, Asian populations have a higher equol-producer prevalence. The additional observation that the prevalence of the ODMA-producer phenotype is lower in KAs suggests that daidzein-metabolizing patterns in general may differ between KAs and CAs. J. Nutr. 136: 1347–1351, 2006.

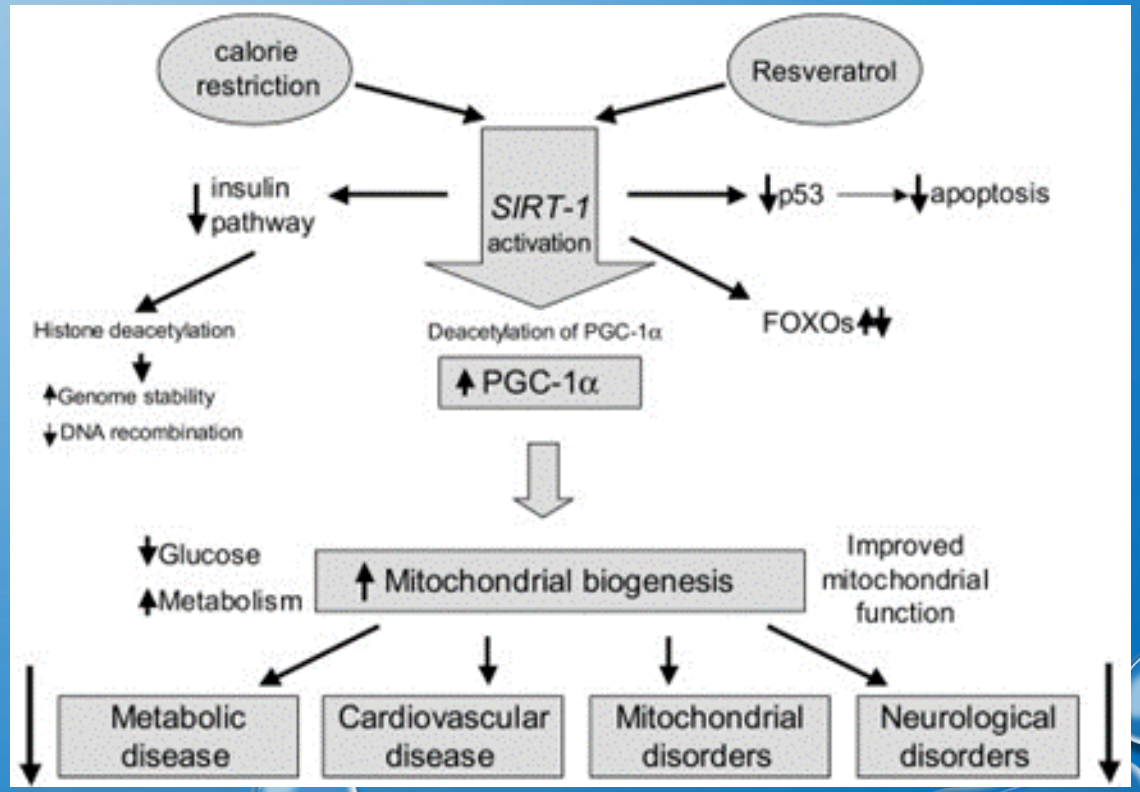
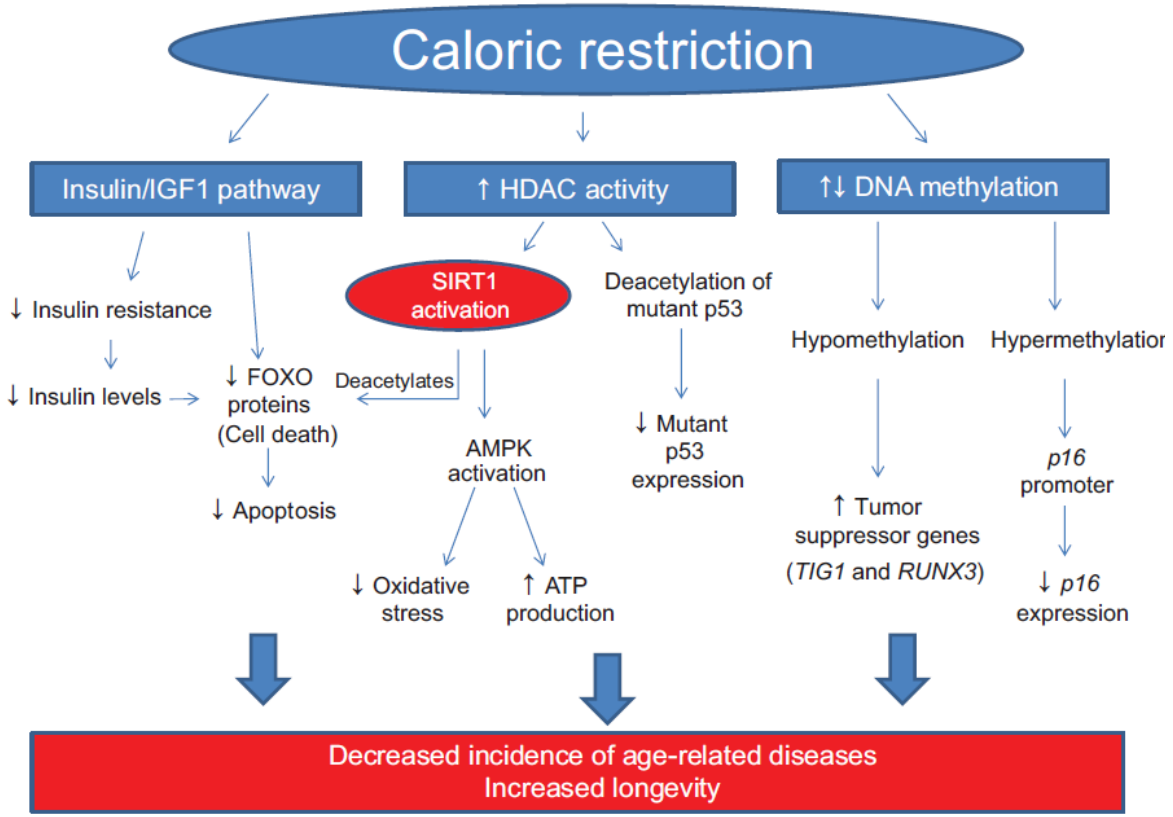
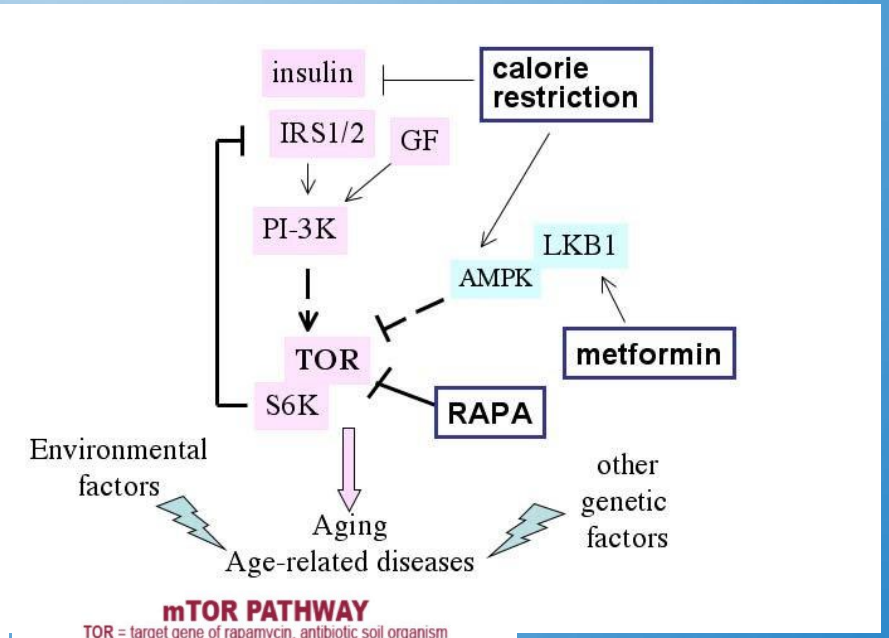
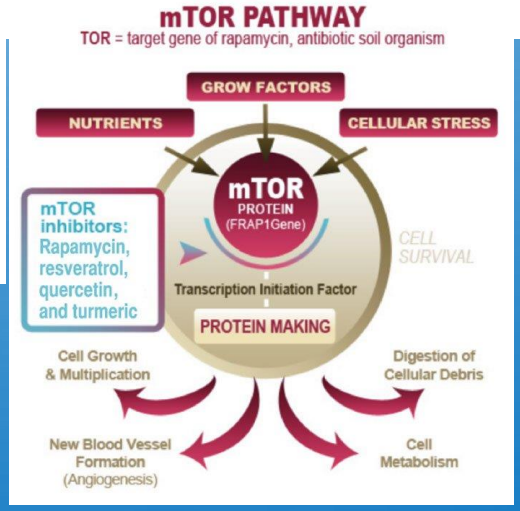
Haslberger 2022



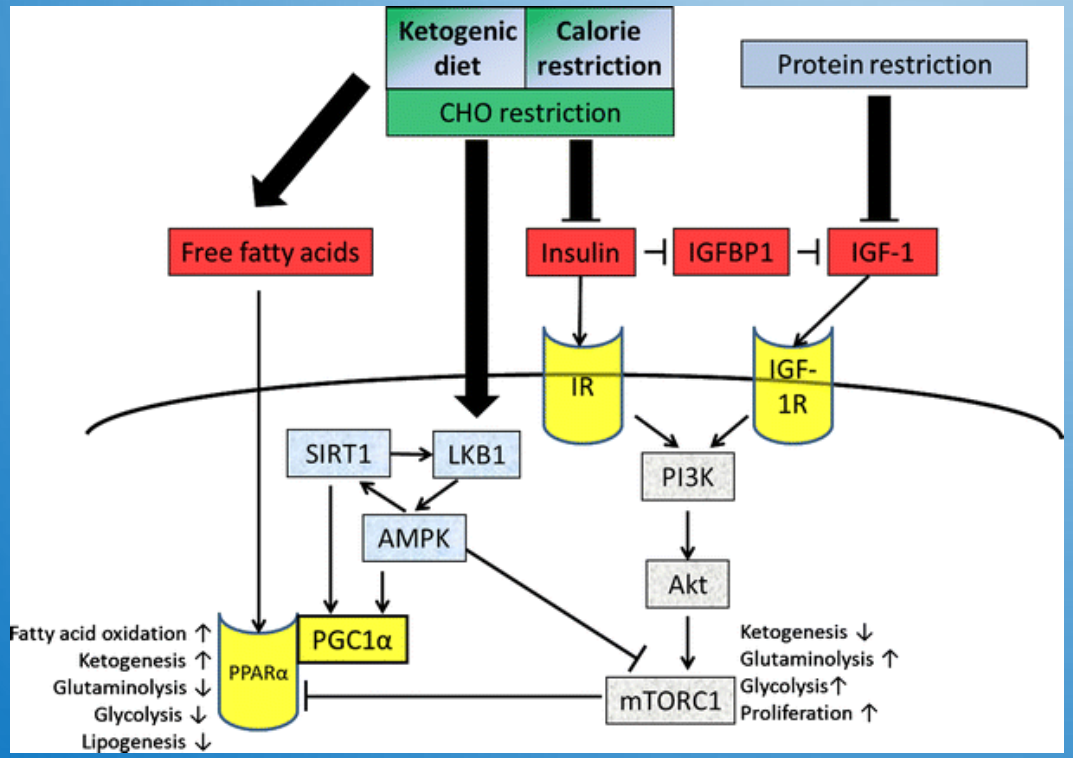
FASTING PATHWAYS: SIRT, MTOR PATHWAYS







CALORIC RESTRICTION, KETOGENIC DIET INVOLVE SIRTS (+NAD, CLOCK GENES) + MTOR PATHWAYS (METFORMIN).



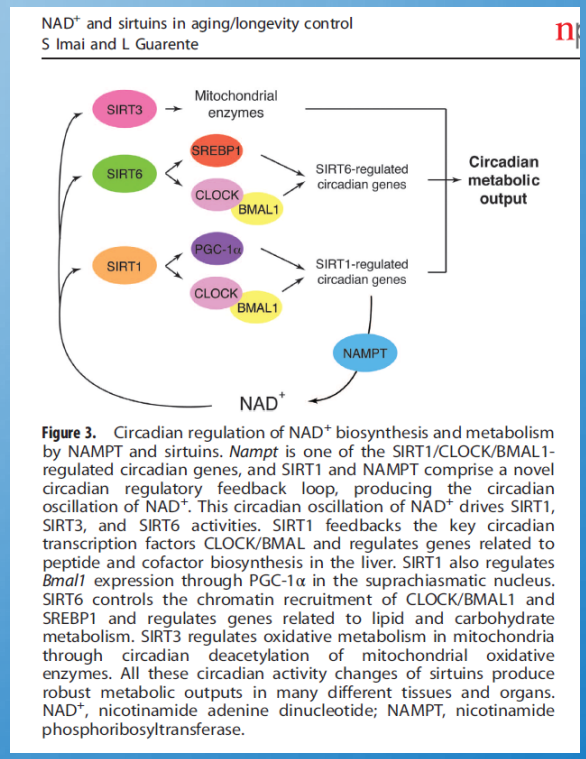


Figure 3. Circadian regulation of NAD$^+$ biosynthesis and metabolism by NAMPT and sirtuins. *Nampt* is one of the SIRT1/CLOCK/BMAL1-regulated circadian genes, and SIRT1 and NAMPT comprise a novel circadian regulatory feedback loop, producing the circadian oscillation of NAD$^+$. This circadian oscillation of NAD$^+$ drives SIRT1, SIRT3, and SIRT6 activities. SIRT1 feedbacks the key circadian transcription factors CLOCK/BMAL and regulates genes related to peptide and cofactor biosynthesis in the liver. SIRT1 also regulates *Bmal1* expression through PGC-1α in the suprachiasmatic nucleus. SIRT6 controls the chromatin recruitment of CLOCK/BMAL1 and SREBP1 and regulates genes related to lipid and carbohydrate metabolism. SIRT3 regulates oxidative metabolism in mitochondria through circadian deacetylation of mitochondrial oxidative enzymes. All these circadian activity changes of sirtuins produce robust metabolic outputs in many different tissues and organs. NAD$^+$, nicotinamide adenine dinucleotide; NAMPT, nicotinamide phosphoribosyltransferase.

ERNÄHRUNG 20.11.2014

Fastenkuren sind gut für den Darm

Studien aus der Tierwelt haben schon öfters bewiesen, dass Fasten das Leben verlängern kann. Untersuchungen zu Menschen gibt es vergleichsweise wenig. Ein Wiener Forscher hat nun aber 60 Probanden im Dienste der Wissenschaft fasten lassen. Ergebnis: Neben allgemeinem Wohlbefinden konnte sich auch die Darmflora erholen.

Why Your Gut Microbes Love Intermittent Fasting

Did you know that most of the cells that make up your body aren't human at all? Some of them are microbial… and when you fast with the LIFE Fasting Tracker app, they fast too.

Conclusions Our results show that caloric restriction affects gut microbiota by proliferating mucin-degrading microbial subpopulations. An additional intervention with a probiotic formula increased probiotic-administered gut microbial populations.

CASE STUDY: COMPARING FASTING AND A FASTING MIMETIC SIRT-FOOD SHOT: MICROBIOTA, EPIGENETICS

STOFF	WIRKSTOFF	MENGE / 25ML	Wirkstoff
Blueberry Extract	Anthocyanins/ Anthocyanidin..	40 mg	14mg 10mg
Broccoli Extract	Sulpharapane, Glucoraphin..	30 mg	
Apfel extract	Phlorentin, Quercetin..	50 mg	
Citrus extract	Naringin..	40 mg	
Nikotinamid	Nikotinamid ribosid	24 mg	
Zinkgluconat	Zink	7.5 mg	

Wasser, Stevia, Erythrit

Buchinger Fasting < 120 kcal/day
n: 22 in Pernegg Monastery

Feces , blood spots, before and
After the end, first sold feces

Active (N. 131) Placebo (n: 30)
Intervention 3 months

Feces, Blood spots before, after 1,3 month

Illuminia sequencing, Line 1 methylation bisulfite qPCR, HR-MCA, RNA, MiRNA RT QPCRi

BUCHINGER FASTING RESULTED IN A RISE IN THE DISTRIBUTION OF PROTEOBACTERIA, INCREASED MICROBIOTA DIVERSITY AND A SIGNIFICANT INCREASE IN CHRISTENSENELLA

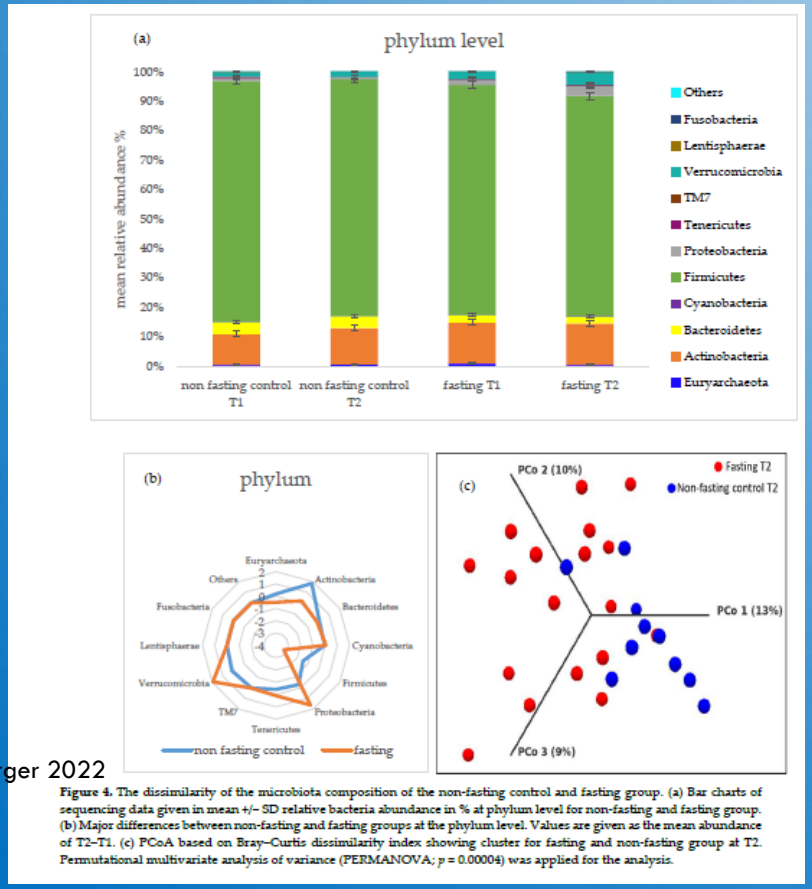

Figure 4. The dissimilarity of the microbiota composition of the non-fasting control and fasting group. (a) Bar charts of sequencing data given in mean +/− SD relative bacteria abundance in % at phylum level for non-fasting and fasting group. (b) Major differences between non-fasting and fasting groups at the phylum level. Values are given as the mean abundance of T2–T1. (c) PCoA based on Bray–Curtis dissimilarity index showing cluster for fasting and non-fasting group at T2. Permutational multivariate analysis of variance (PERMANOVA; $p = 0.00004$) was applied for the analysis.

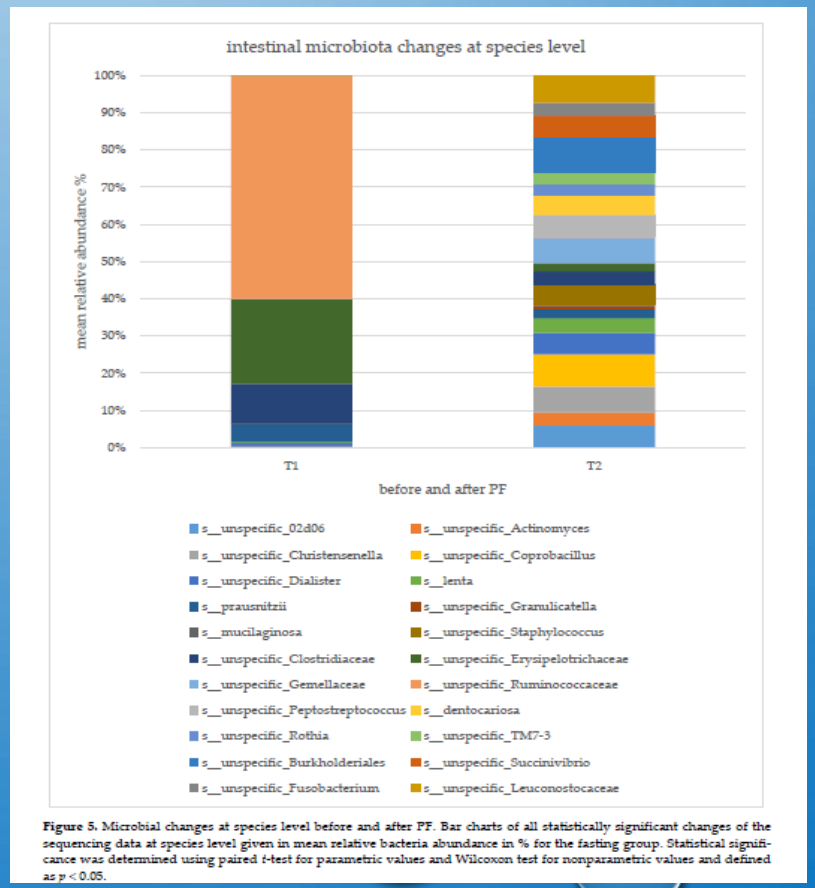

Figure 5. Microbial changes at species level before and after PF. Bar charts of all statistically significant changes of the sequencing data at species level given in mean relative bacteria abundance in % for the fasting group. Statistical significance was determined using paired *t*-test for parametric values and Wilcoxon test for nonparametric values and defined as $p < 0.05$.

3M SIRT INDUCING DRINK INCREASED *ACTINOBACTERIA*. FIRMICUTES/*BACTEROIDETES* RATIO DECREASED AND CORRELATED WITH BMI. ONLY FASTING INCREASED BUTYRATE SIGNIFICANTLY

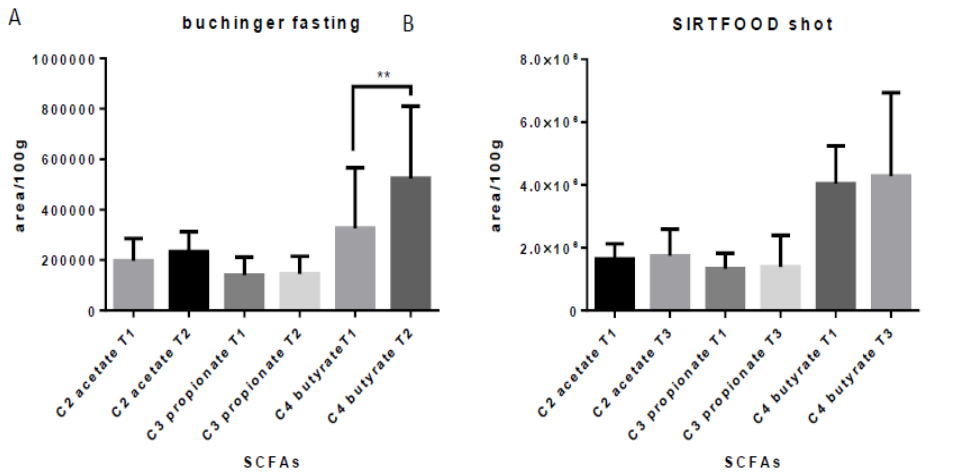

Figure 7: Amount of SCFAs produced given as area/100g stool for buchinger fasting (A) and SIRTFOOD shot (B) interventions. Statistical significance between timepoint 1 (T1) and end (T2 or T3) of the intervention was determined using paired t-test for parametric values and Wilcoxon test for nonparametric values.

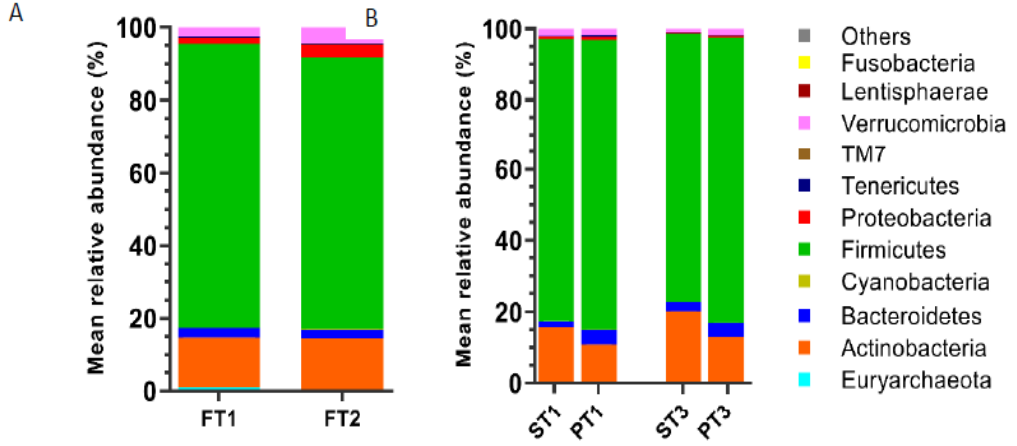

Figure 6: Abundance microbiota by phyla for fasting group (A), SIRTFOOD shot (ST1 vs ST3) (B) and placebo group (PT1 vs PT3) (B). Results are expressed in percentage of the mean of relative abundance for the different phyla. Statistical significance between timepoint 1 (T1) and end (T2 or T3) of the intervention was determined using paired t-test for parametric values and Wilcoxon test for nonparametric values.

POSITIVE CORRELATION OF THE ABUNDANCE OF BUTYRATE-PRODUCING *BACTEROIDETES* WITH MIR125, SIRT-1 EXPRESSION, TELOMERE LENGTH

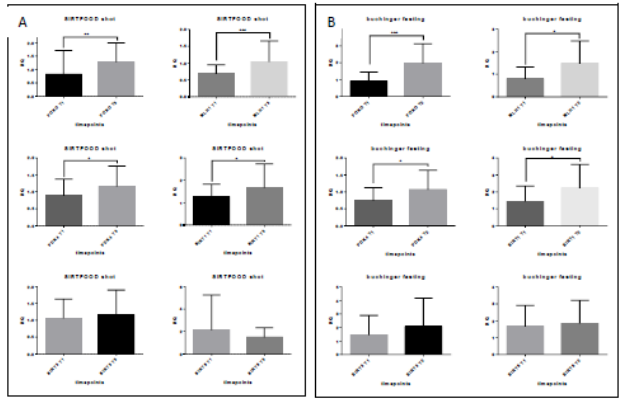

Figure 4: RQ selected mRNA gene expression (*FoxO1, MLH1, PDK4, SIRT1, SIRT3, SIRT6*) SIRTFOOD shot and buchinger fasting. The results are expressed as mean +/- SD. Statistical significance between timepoint 1 (T1) and end (T2 or T3) of the intervention was determined using paired t-test for parametric values and Wilcoxon test for nonparametric values.

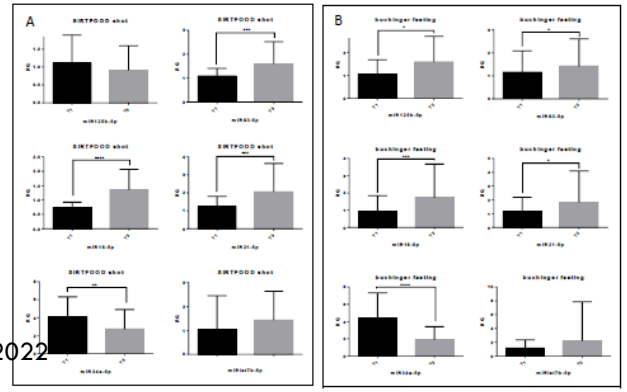

Figure 5: RQ selected miRNA gene expression (*miR125b-5p, miR93-5p, miR16-5p, miR21-5p, miR34a-5p, miRlet7b-5p*) SIRTFOOD shot and buchinger fasting. The results are expressed as mean +/- SD. Statistical significance between timepoint 1 (T1) and end (T2 or T3) of the intervention was determined using paired t-test for parametric values and Wilcoxon test for nonparametric values.

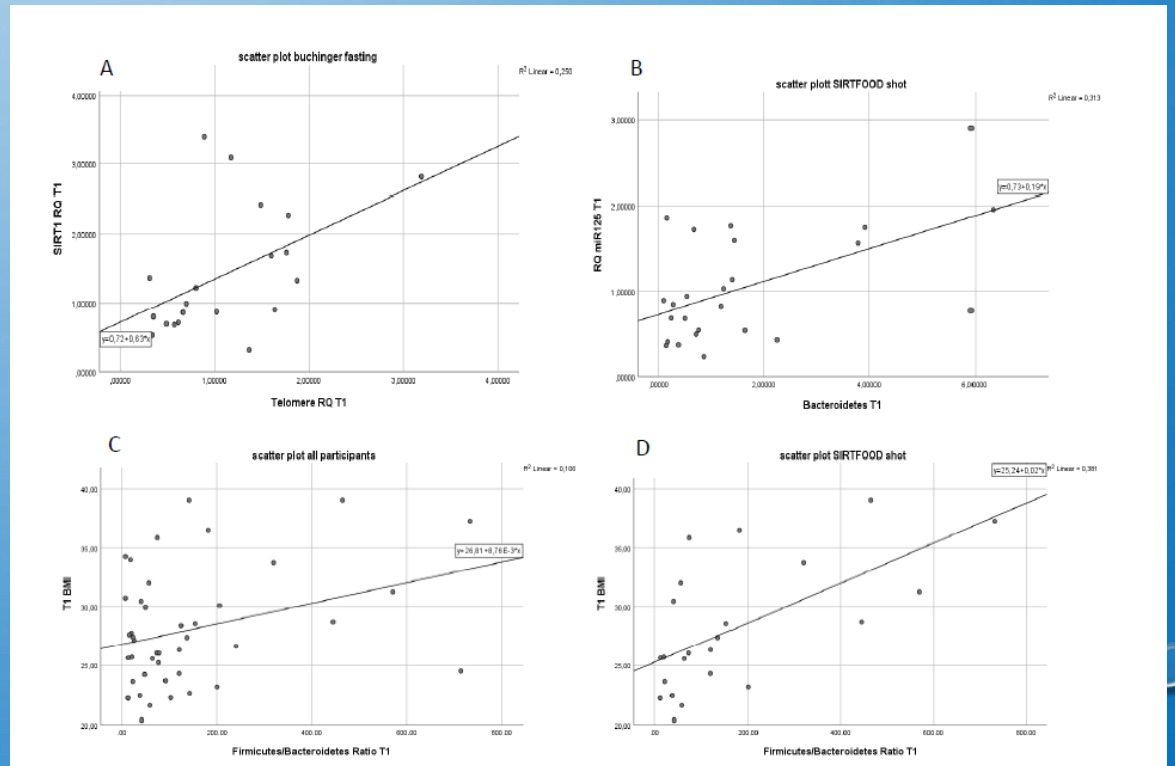

Figure 8: spss output scatter plots. (A) shows a positive correlation between telomere length and SIRT1 expression for buchinger fasting at baseline. Bacteroidetes and miR125b-5p positively correlated in the SIRTFOOD shot intervention at baseline(B). For all participants the ratio of Firmicutes/Bacteroidetes increased with higher BMI (C), which was also seen for the SIRTFOOD shot intervention Discussion (D). Statistical significance was defined as $p < 0.05$.

CONCLUSIONS

In conclusion fasting and to some extend fasting mimetics result in beneficial modulation of microbiota (e.g diversity, SCFA, BHP) and metabolism (e.g SIRTS, mtDNA, telomer length)

Microbiota structure seems to interfere with the expression of Sirtuins and metabolism relevant miRNAs

PATHWAYS AND CROSS FEEDING FOR SCFAS/ BUTYRATE

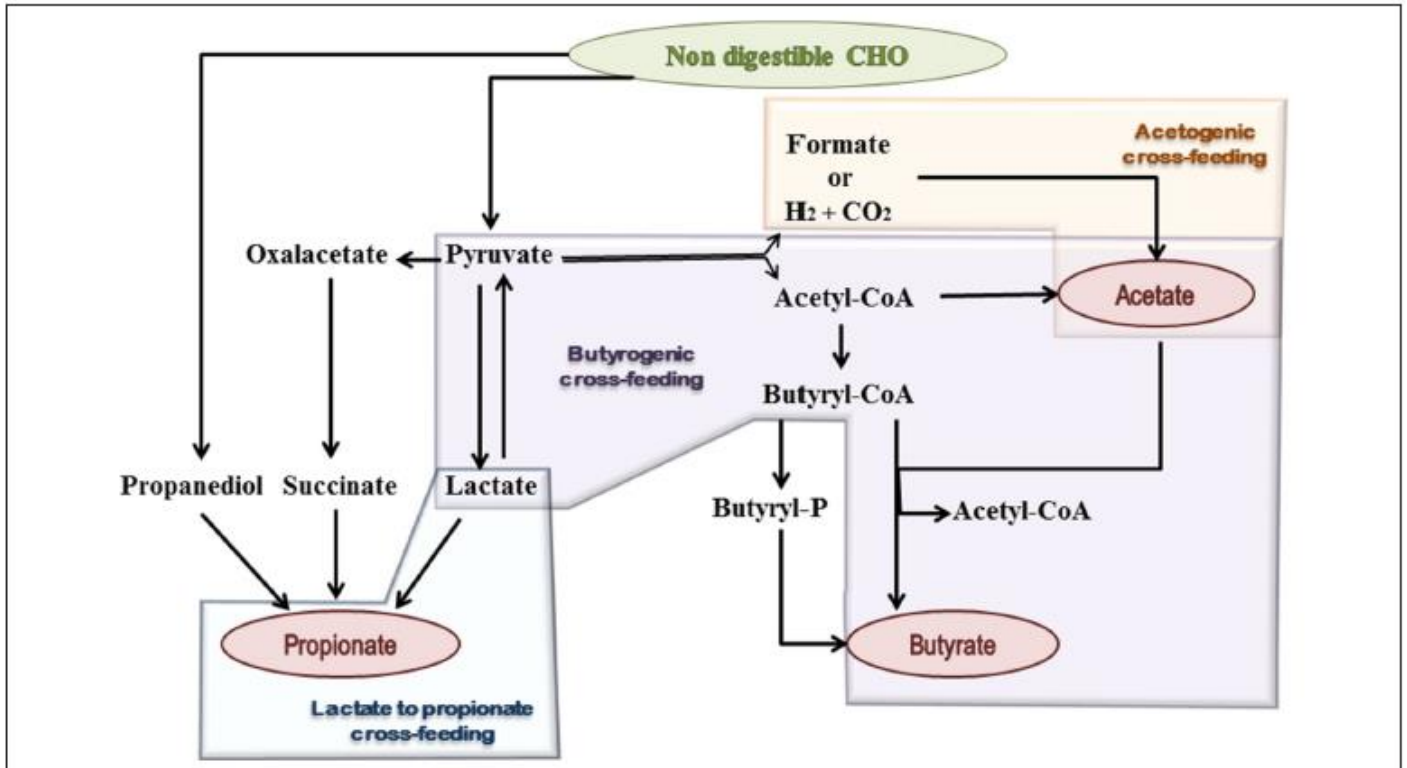

FIGURE 1 | Schematic representation of microbial metabolic pathways and cross-feeding mechanisms, contributing to SCFA formation in the human gut. Shaded geometric shapes summarize routes of formation for each of the three main SCFA: acetate, propionate, and butyrate.

BUTYRATE AND EPIGENETICS

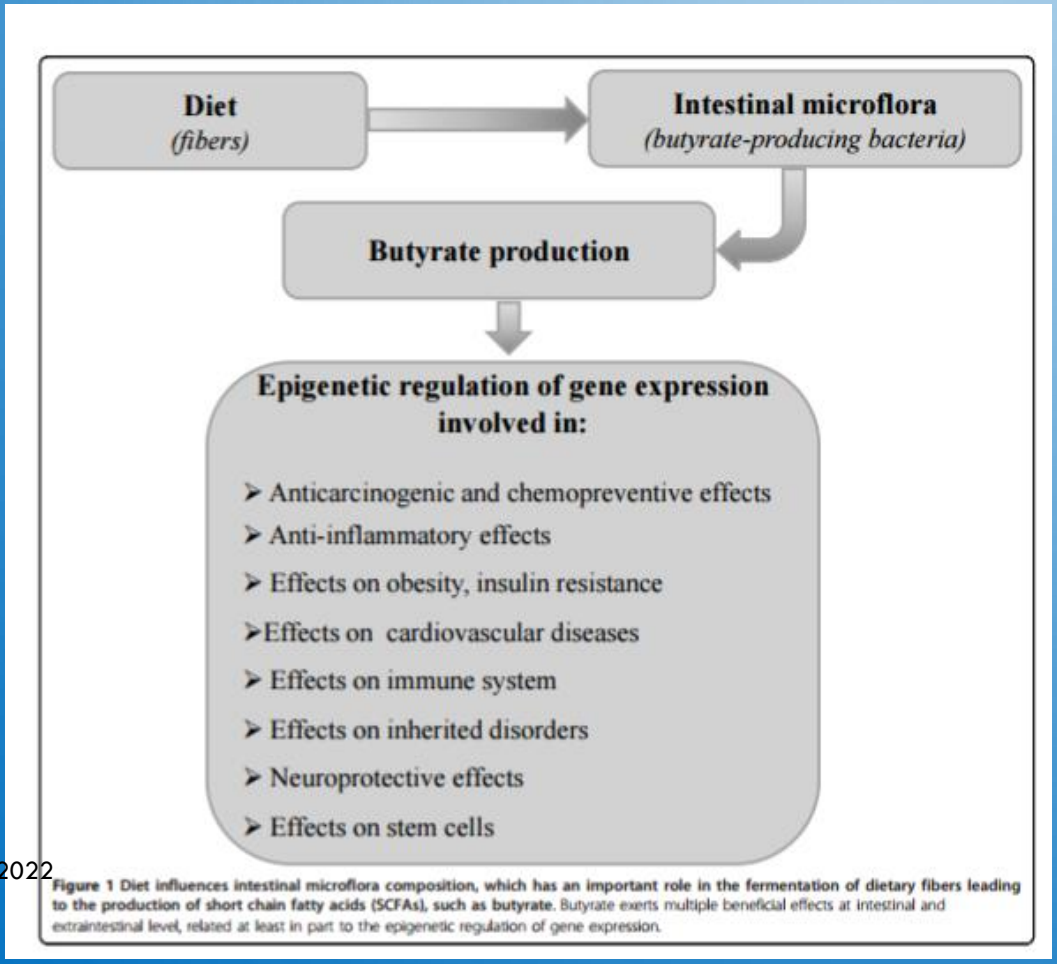

Figure 1 Diet influences intestinal microflora composition, which has an important role in the fermentation of dietary fibers leading to the production of short chain fatty acids (SCFAs), such as butyrate. Butyrate exerts multiple beneficial effects at intestinal and extraintestinal level, related at least in part to the epigenetic regulation of gene expression.

BUTYRATE: WHERE AND HOW MUCH ?

For good reason it is not possible with current technologies to perform direct measurements of the variation in the butyrate concentration in the portal vein of human subjects, but short-chain fatty acid levels in portal blood from sudden-death victims, subjects undergoing emergency surgery or planned surgery have indicated a higher gut production and absolute and relative concentration of butyrate in non-fasted as compared with fasted human subjects

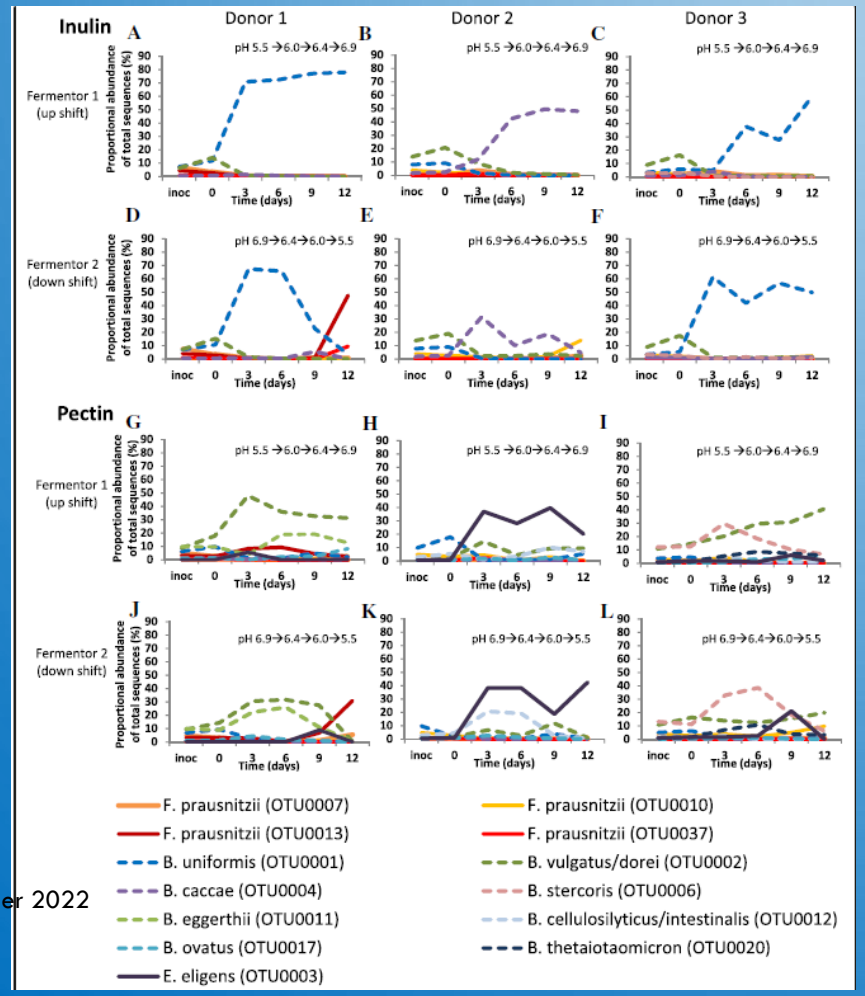
MICROBIOTA AND SCFA RESPONSES VARY VERY INDIVIDUALLY



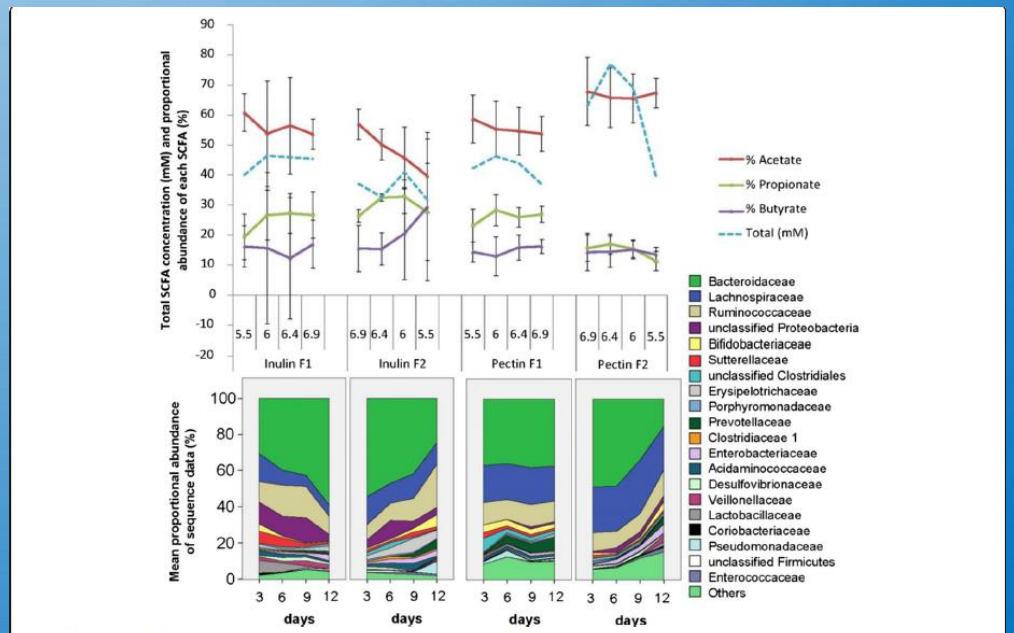


Fig. 7 Short chain fatty acids (SCFA) in upshift and downshift fermentors. Mean SCFA values (means and standard deviations) and proportional abundance of bacterial families based on sequence analysis of 16S rRNA gene amplicons are shown for the 16 fermentor runs described in Fig. 3. Significant changes in % SCFA (from ANOVA) are discussed in the text. ANOVA revealed significant decreases in % Bacteroidaceae between pH 6.9 and pH 5.5 in inulin fermentors F1 ($P = 0.015$) and F2 ($P = 0.012$), but with pectin only for the F2 (downshift) fermentors ($P = 0.0001$). % Bifidobacteriaceae and % Lachnospiraceae increased significantly at pH 5.5 compared with pH 6.9 in F2 inulin ($P = 0.007$) and F1 inulin ($P = 0.025$) fermentors, respectively

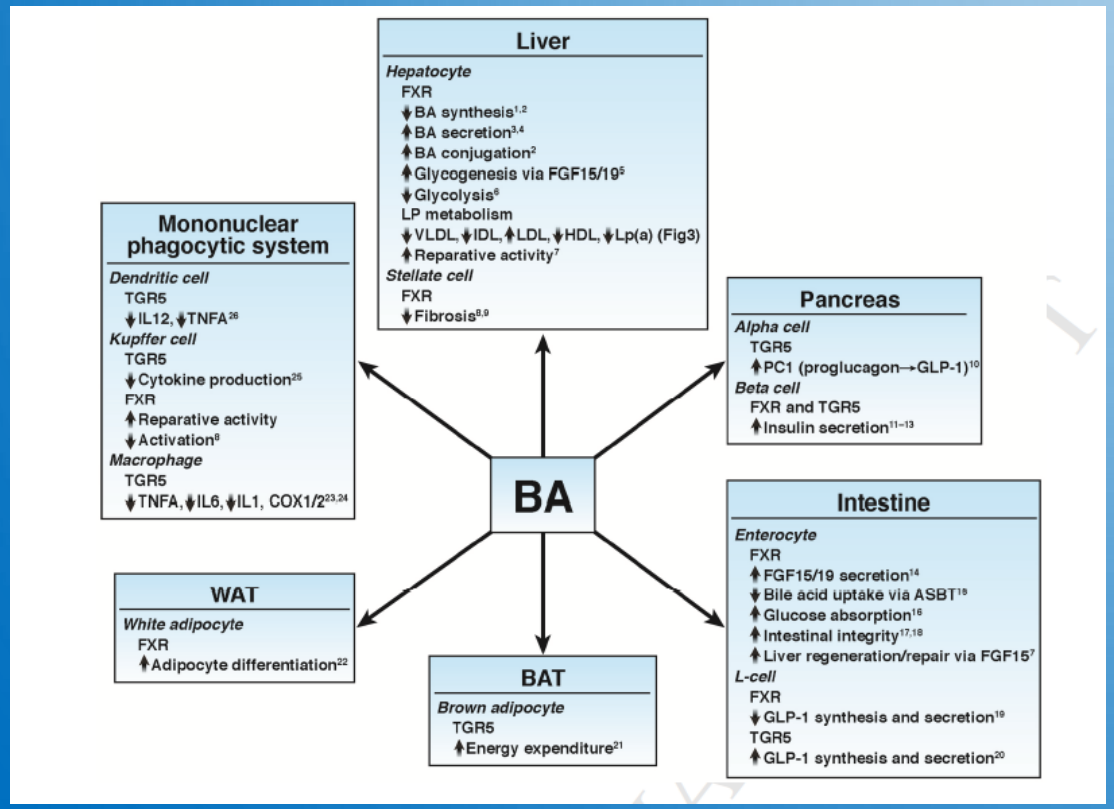
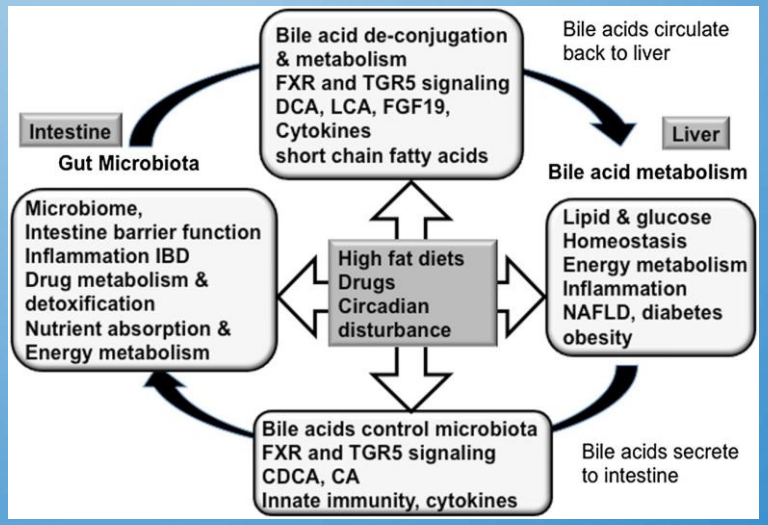
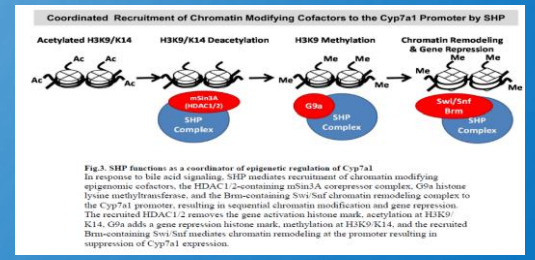
MICROBIOTA MODULATED BILE ACIDS ARE EPIGENETICALLY ACTIVE AND VIA FXR REGULATE INFLAMMATION



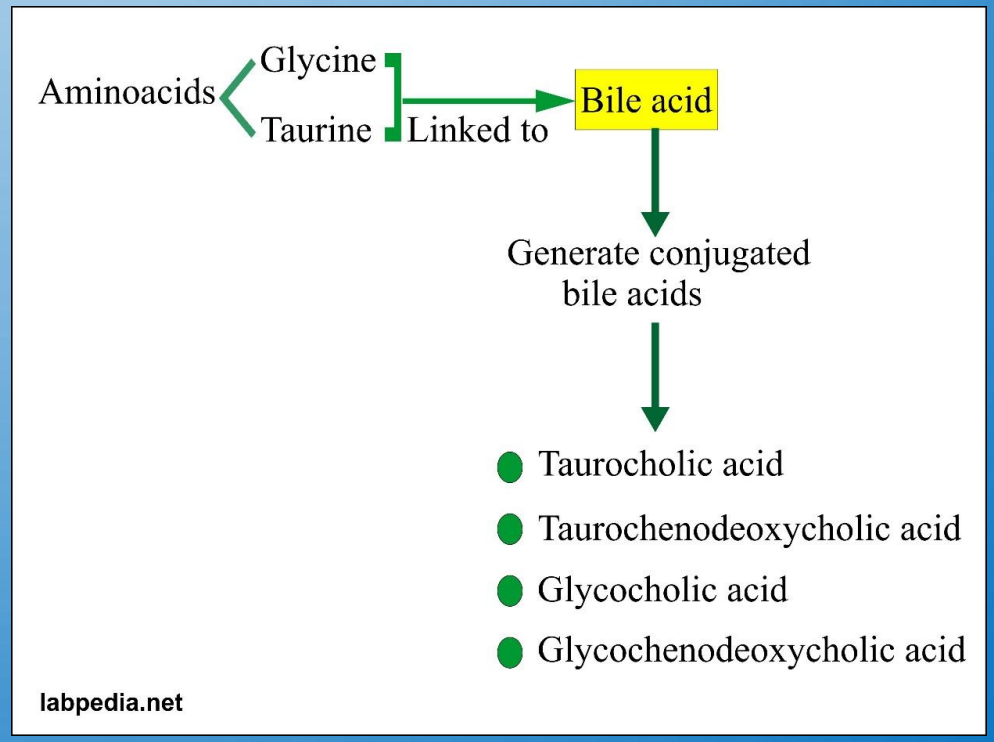




Bile acid control of metabolism and inflammation in obesity, type 2 diabetes, dyslipidemia and NAFLD
Oscar Chávez-Talavera, et al, 2017

BILE ACIDS

Primary bile acids are synthesized by the liver. Secondary bile acids result from bacterial actions in the colon. In humans, taurocholic acid and glycocholic acid (derivatives of cholic acid) and taurochenodeoxycholic acid and glycochenodeoxycholic acid (derivatives of chenodeoxycholic acid) are the major bile salts in bile and are roughly equal in concentration



GUT BRAIN / IMMUNE- AXIS

Effects of intestinal microbiota on anxiety-like behavior

Karen-Anne M. Neufeld,[1,4] Nancy Kang,[1,2] John Bienenstock[1,3] and Jane A. Foster[1,2,*]
[1]Brain-Body Institute; St. Joseph's Healthcare; [2]Department of Psychiatry and Behavioral Neurosciences; [3]Department of Pathology and Molecular Medicine; [4]Medical Sciences Graduate Program; McMaster University; Hamilton, ON Canada

The acquisition of intestinal microbiota in the immediate postnatal period has a defining impact on the development and function of many immune and metabolic systems integral to health and well-being. Recent research has shown that the presence of gut microbiota regulates the set point for hypothalamic-pituitary-adrenal (HPA) axis activity.[1] Accordingly, we sought to investigate if there were other changes of brain function such as behavioral alterations in germ free (GF) mice, and if so, to compare these to behavior of mice with normal gut microbiota. Our recent paper showed reduced anxiety-like behavior in the elevated plus maze (EPM) in adult GF mice when compared to conventionally reared specific pathogen-free (SPF) mice.[2] Here, we present data collected when we next colonized the adult GF mice with SPF feces thereby introducing normal gut microbiota, and then reassessed anxiety-like behavior. Interestingly, the anxiolytic behavioral phenotype observed in GF mice persisted after colonization with SPF intestinal microbiota. These data show that gut-brain interactions are important to CNS development of stress systems and that a critical window may exist after which reconstitution of microbiota and the immune system does not normalize the behavioral phenotype.

Key words: germ free, microbiota, anxiety-like behavior, gut-brain, elevated plus maze
Submitted: 04/06/11

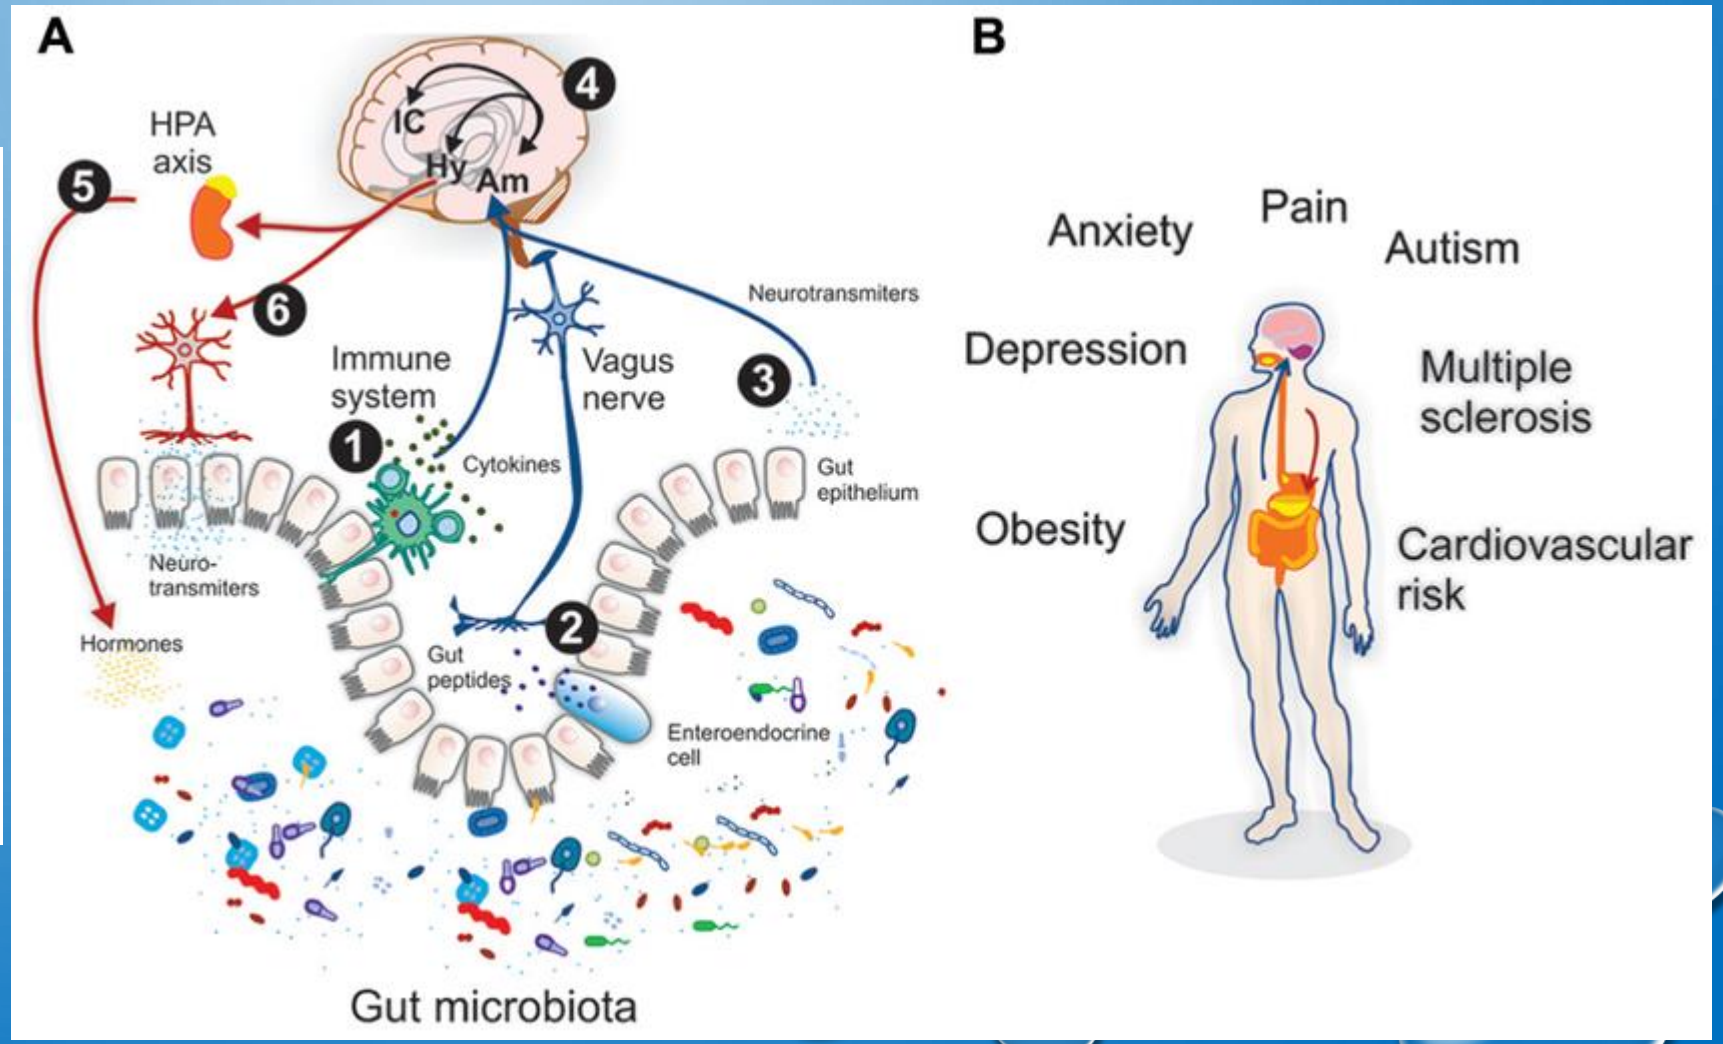
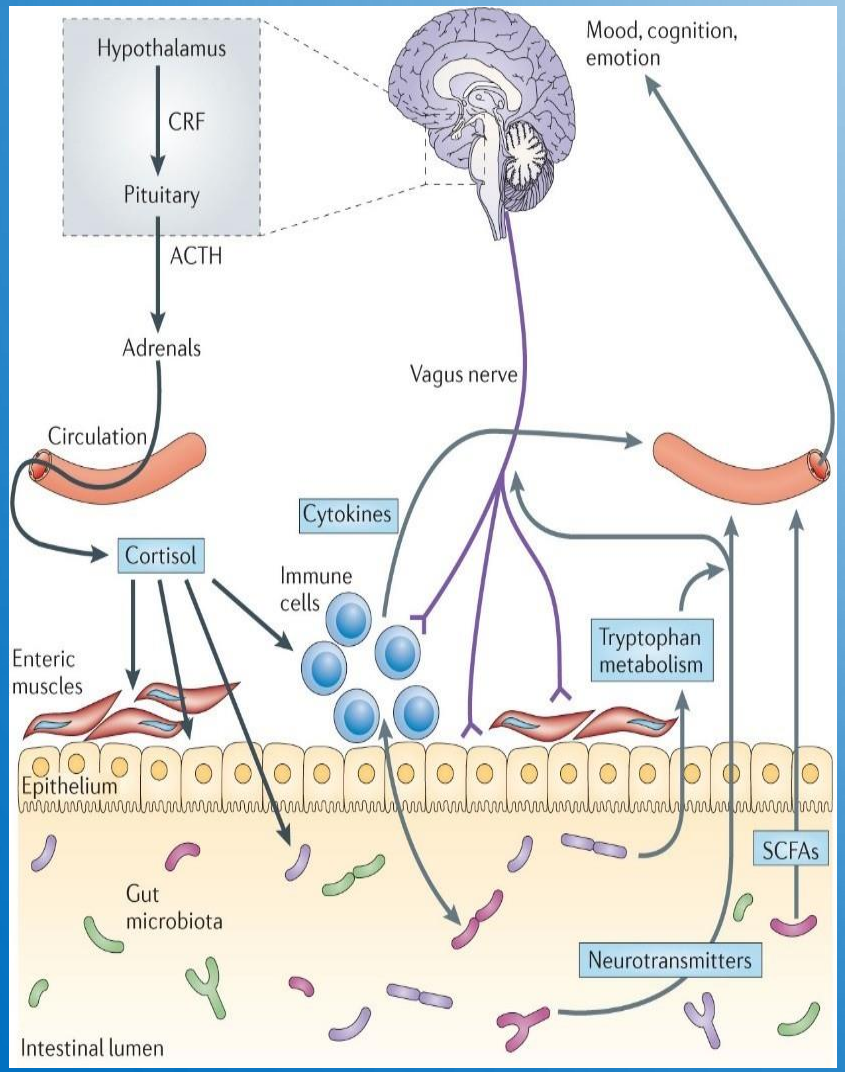
comorbidity found between mood and anxiety disorders and both inflammatory bowel disease and the functional bowel disorders.[6-8] Indeed the focus of Rome III, a diagnostic instrument designed to aid clinicians in the diagnosis of functional bowel disorders such as irritable bowel syndrome (IBS), is on gut, brain and spinal cord interactions and their involvement in the generation of symptoms of pain and intestinal dysfunction.[9] Luminal contents have also become a focus of study in the etiology of functional bowel disorders, with a number of studies pointing to variations in the composition of gut microbiota in patients suffering from IBS compared to controls.[10] A recent report found that compared to specific pathogen-free (SPF) mice, adult germ free mice showed an exaggerated stress response, as evidenced by increased plasma corticosterone (CORT) and adrenocorticotrophic hormone (ACTH) levels in response to restraint stress.[1] Clearly the study of the impact of gut microbiota on the development of HPA dysfunction and potentially anxiety-like behavior has important clinical applications in the study of both gastrointestinal and psychiatric health and disease, as they are essentially involved in the communication between the gut and the brain.

We propose that the intestinal microbiota housed within the gastrointestinal

Haslberger 2022

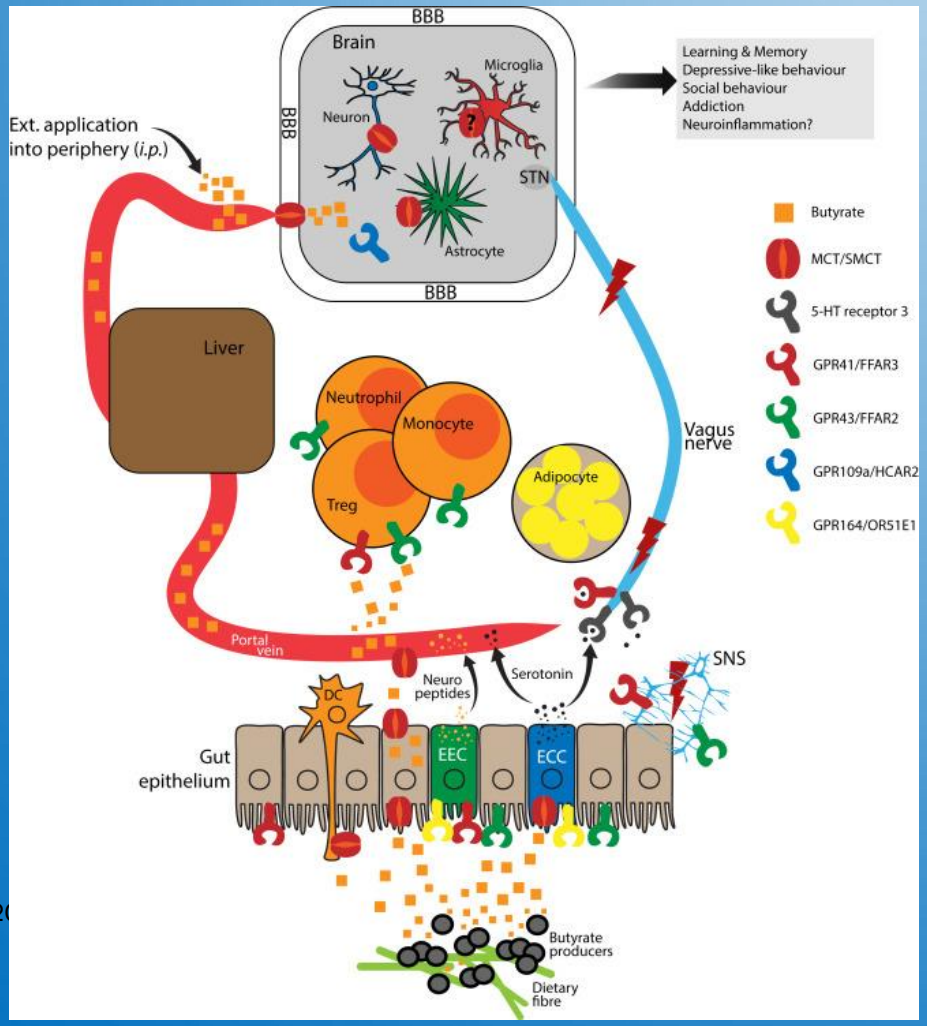


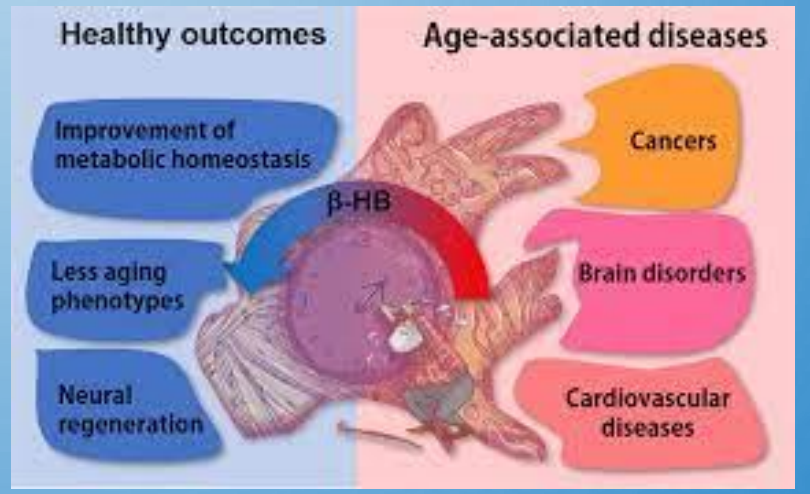
Gut-Microbiota-Brain Communication

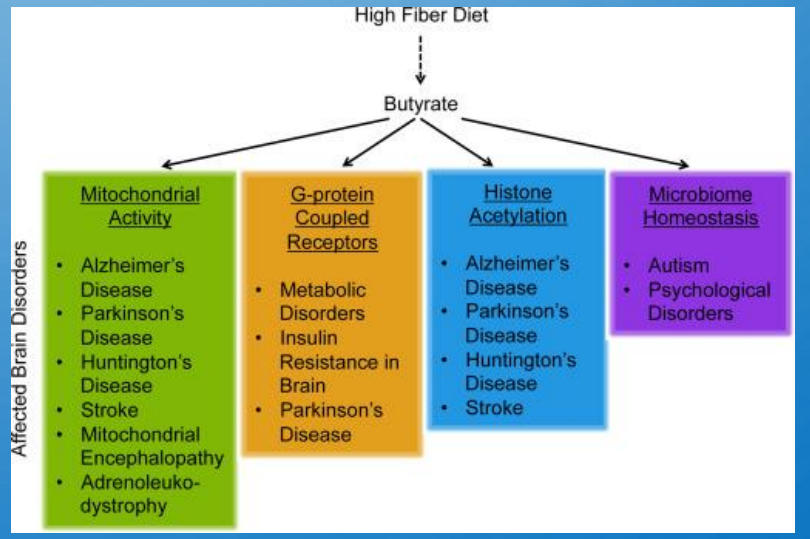


- Bidirectional communication
  - Central nervous system (brain and spinal cord)
  - Autonomic nervous system (sympathetic and parasympathetic)
  - Enteric nervous system (intrinsic nervous system of GI tract)
  - Hypothalamic pituitary adrenal axis (HPA)
  - Microbiome (collection of microorganisms and their genomes in the gut)

BUTYRATE, BETA-HYDROXYBUTYRATE AND THE BRAIN







VAGUS NERVE

- Major nerve of the parasympathetic division of the autonomic nervous system
- Important pathway for bidirectional communication between the gut microbes and the brain
- Preclinical/animal studies demonstrate that probiotic effects on brain are dependent on vagal afferent signals
  - *Lactobacillus rhamnosus* directly activates vagal neurons
  - Induces region-dependent alterations in GABA receptor expression in the brain and reduced stress-induced corticosterone and anxiety- and depression-like symptoms via vagus nerve signaling in mice
- Vagotomized mice do not exhibit this effect

PROBIOTIC

- POSITIVE EFFECTS ON HEALTH ALREADY 100 YEARS AGO SUGGESTED BY NOBEL PRIZE WINNER ELIE METCHNIKOFF [METCHNIKOFF, 2004]
- DEFINITION: "LIVE MICROORGANISMS THAT, WHEN ADMINISTERED IN ADEQUATE AMOUNTS, CONFER A HEALTH BENEFIT ON THE HOST" [FAO/WHO, 2002]
- OVER 8000 RESEARCH ARTICLES PUBLISHED SINCE 2002 → SEVERAL PROBIOTIC PRODUCTS ON THE MARKET [HILL ET AL., 2014]
- CELL COMPONENTS OF PROBIOTICS ABLE TO INDUCE EFFECTS IN HOST [DOTAN AND RACHMILEWITZ, 2005] BUT REQUIREMENT FOR SURVIVABLE CELLS REMAINS A CRUCIAL FACTOR FOR EFFICACY [MA ET AL., 2004]

ANTIMICROBIAL SUBSTANCES

- PROBIOTICS PRODUCE VARIOUS ANTIMICROBIAL ACTING SUBSTANCES
- EXAMPLES: LACTIC ACID, HYDROGEN PEROXIDE, MICROCINES, DECONJUGATED BILE ACIDS [OELSCHLAEGER, 2010], BACTERIOCINS [MAQUEDA ET AL., 2008]
- ANTIBIOTICS ALSO PRODUCED BY PROBIOTICS → REUTERIN:
  - BROAD-SPECTRUM ANTIBIOTIC
  - ACTIVE AGAINST YEAST, GRAM-POSITIVE AND GRAM-NEGATIVE BACTERIA, FUNGI, VIRUSES, PROTOZOA
  - PRODUCED BY STRAIN ATCC55730 FROM L. REUTERI [CLEUSIX ET AL., 2007]

SPECIES

- LACTOBACILLI:
  - PRESENT IN GIT, ORAL CAVITY AND VAGINA OF HUMANS [WALTER, 2008]
  - WIDESPREAD USE IN PRODUCTION AND FERMENTATION OF FOODS → ABILITY TO CONVERT HEXOSE SUGARS TO LACTIC ACID → PRESERVATION [FIJAN, 2014]
  - EXCELLENT FOR USE AS PROBIOTICS: HIGH TOLERANCE TO ACID AND BILE, CAPABILITY TO ADHERE TO INTESTINAL SURFACES [TULUMOGLU ET AL., 2013]
- BIFIDOBACTERIA:
  - FIRST COLONIZERS OF THE HUMAN GUT TOGETHER WITH LACTOBACILLI [TURRONI ET AL., 2012]
  - WELL KNOWN FOR RESISTANCE AGAINST BILE SALTS [FIJAN, 2014]

SPECIES

- BACILLUS SPECIES:
  - EITHER SPORE-FORMING AEROBIC OR FACULTATIVE AEROBIC, GRAM POSITIVE BACTERIA
  - B. SUBTILIS, B. CEREUS, B. COAGULANS ARE MEMBERS WITH PROBIOTIC CHARACTERISTICS [FIJAN, 2014]
- ESCHERICHA COLI NISSLE 1917:
  - ABLE TO COLONIZE THE GUT AND COMPETE WITH RESIDENT AND PATHOGENIC BACTERIA THROUGH MULTIPLE FITNESS FACTORS [BEHNSEN ET AL., 2013]
  - STIMULATION OF EPITHELIAL DEFENSIN PRODUCTION → RESTORATION OF DISTURBED GUT BARRIER
  - „SEALING EFFECT“ ON TIGHT JUNCTIONS OF ENTEROCYTES [SONNENBORN AND SCHULZE, 2009]

PROBIOTIC : SPECIES : STRAIN SPECIFICITY

Beispiele stammspezifischer Wirkungen von Probiotika	
Abkürzungen: L: Lactobacillus; B: Bifidobacterium; Ssp: subspecies. Stammbezeichnung zwischen Klammern.	
L. acidophilus (LA1):	▪ wirkt bei der Milchzuckerverdauung mit. ▪ besitzt die Fähigkeit, wichtige Vitamine wie Folsäure, Vitamin B3 und B6 herzustellen, um sie dann dem Organismus zuzuführen.
L. bulgaricus (LB2):	▪ ist in der Lage, Milchzucker in Milchsäure umzusetzen. ▪ besitzt die Fähigkeit, den pH-Wert in einem günstigen Bereich zu halten, somit wird schädliches Bakterienwachstum eingedämmt.
L. casei (LC03):	▪ spielt bei der Abwehr von Salmonellen oder ähnlichen schädlichen Bakterien eine sehr wichtige Rolle ▪ trägt dazu bei, gravierende Infektionen zu verhindern.
L. salviarius (LS04):	▪ wirkt generell positiv auf den Zustand der Haut. ▪ stärkt die Mundschleimhaut und hilft, Zahnfleischbluten vorzubeugen bzw. zu verhindern.
L. paracasei (101/37):	▪ wirkt bereits im Mund und beugt der Entstehung von Karies vor. ▪ verbessert die Immunabwehr gegen eine Vielzahl von Krankheitserregern.
L. rhamnosus (LR1):	▪ sehr widerstandsfähig gegenüber Magensäure und Gallensäften im Dünndarm. Es schützt dadurch andere Milchsäurebakterien auf ihrem Weg durch den Dickdarm.
L. plantarum (14D):	▪ wirkt bei der Verdauung von Milch mit und hat eine positive Wirkung auf den Cholesterinspiegel.
B. longum ssp. infantis (Bi-26):	▪ ist ein wichtiger Vitaminproduzent (Folsäure, Vitamin B1, Niacin, B6 und Biotin). ▪ kann Durchfall entgegenwirken, indem es die auslösenden Bakterien verdrängt.
B. animalis ssp. lactis (Bi1):	▪ bildet keine Gase und wirkt somit Blähungen entgegen. ▪ heftet sich an die Darmschleimhaut an und steuert dort die Durchlässigkeit. ▪ stimuliert die Immunabwehr.
B. longum (BL21):	▪ hat eine hohe Bedeutung für die Immunabwehr und die Bildung von Vitaminen. ▪ unterstützt die Aufnahme von Calcium (Anzahl verringert sich im Alter).
B. breve (Bbr8):	▪ verarbeitet viele schwerverdauliche Substanzen und verbessert somit die Darmtätigkeit. ▪ verringert sowohl das Auftreten von Durchfall, als auch von Verstopfung. ▪ verringert Allergien (Überreaktion von Immunzellen wird gehemmt – Anzahl verringert sich im Alter).
B. bifidum (BB04):	▪ kann verschiedene Säuren produzieren und hat einen positiven Einfluss auf die Immunabwehr.
Streptococus thermophilus (Z57):	▪ lindert Antibiotika-assoziierten Durchfall.

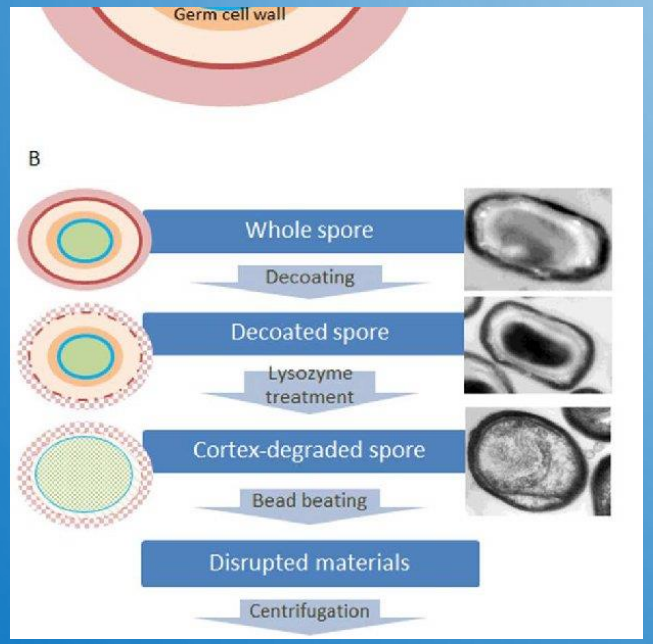
In the last years several human commensals have emerged from the gut microbiota studies as potential probiotics or therapeutic agents. Strains of human gut inhabitants such as *Akkermansia*, *Bacteroides*, or *Faecalibacterium* have shown several interesting bioactivities and are thus currently being considered as food supplements or as live biotherapeutics, as is already the case with other human commensals such as bifidobacteria. The large-scale use of

SPORES



The ingredient

According to Deerland, DE111 is a genome sequenced strain of *Bacillus subtilis*. The genome sequencing confirmed the strain contained no plasmids, antibiotic resistant or deleterious genes; the human clinical studies showed the strain's ability to control microbial populations, aid in digestion and maintain general health. Because the strain is a spore former it remains viable under a wide temperature and pH range, making it ideal for use in supplements as well as food and beverages.

(Received 10 April 1988; revision received 6 January 1989; accepted 18 January 1989)

Key words: Pharmacokinetics; Butyrate; Experimental animal; Man

Summary

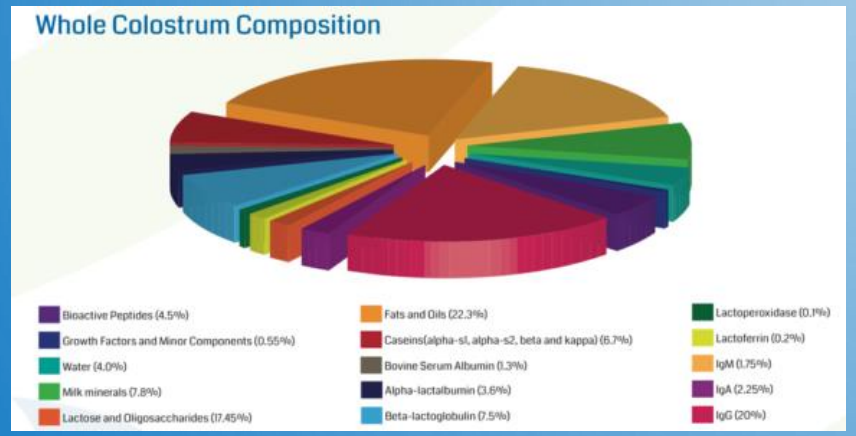
Considering that butyrate-treated malignant cells can recover in a transitory fashion a non-cancerous phenotype, the authors carried out a pharmacokinetics study of butyric acid injected as sodium or arginine salts for possible antitumor therapies.

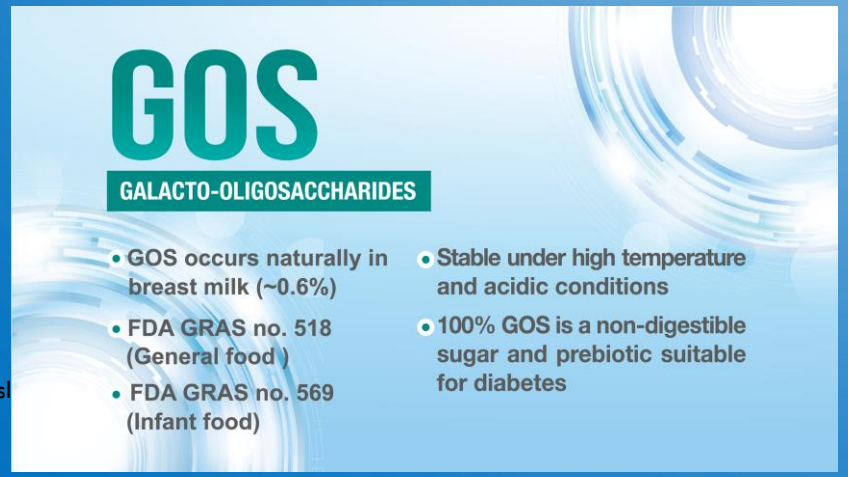
In the case of 1-^{14}C-labelled butyrate, the appearance of radioactivity in the blood of injected mice is rapid and some of it is maintained for relatively long periods in different organs, mainly the liver. However, no precision can be given about the structure of radioactive compounds in blood and tissues.

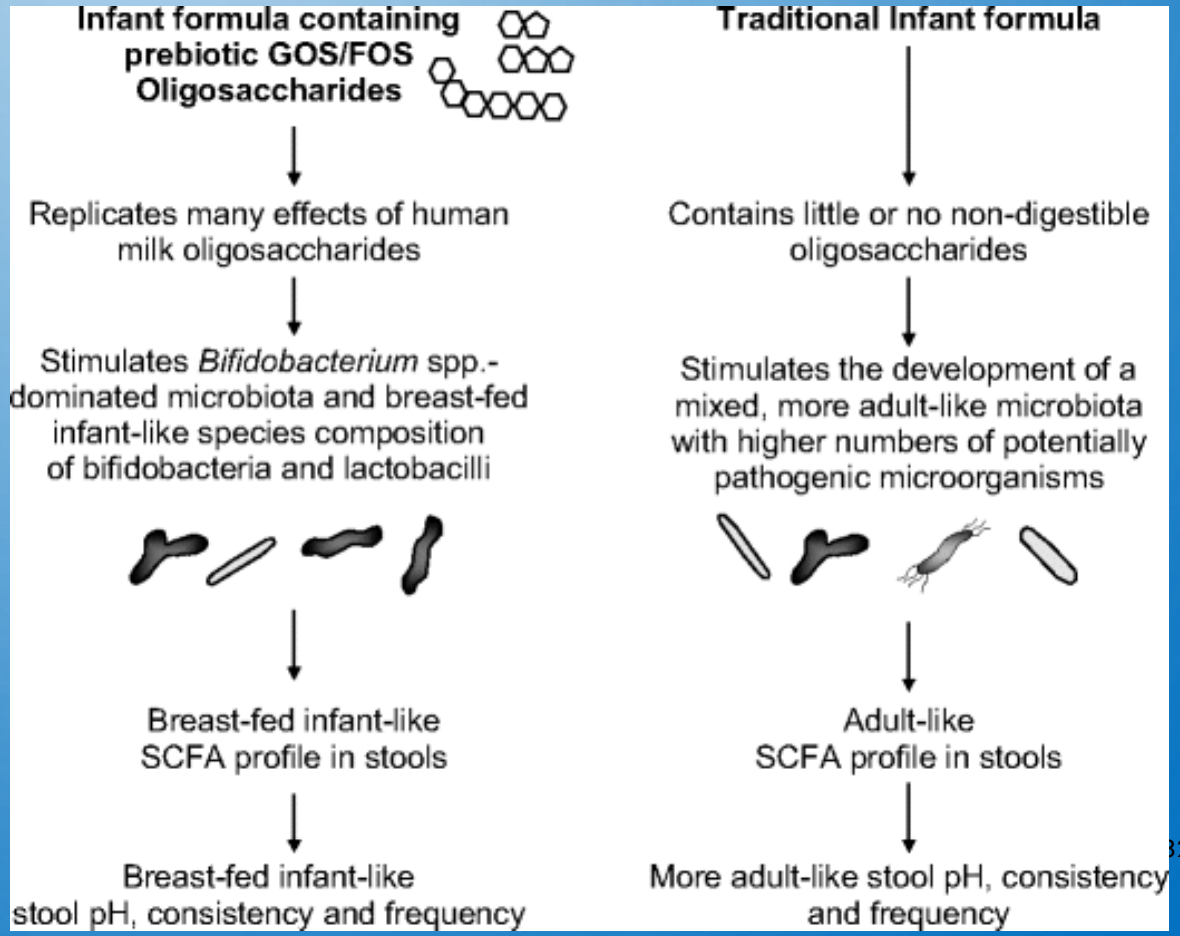
Using gas–liquid chromatography, the authors studied the metabolism of butyrate in both animals and man. In mice and rabbits, the half-life is < 5 min. In man, the butyric acid elimination curve can be divided into two parts corresponding to two half-lives: for the first (0.5 min), the slope suggests an accelerated excretion, while for the following (13.7 min), a slow plateau is observed.

The rapid elimination of butyrate is a limiting factor for practical applications. However, the lack of toxicity supports its use in human therapy.

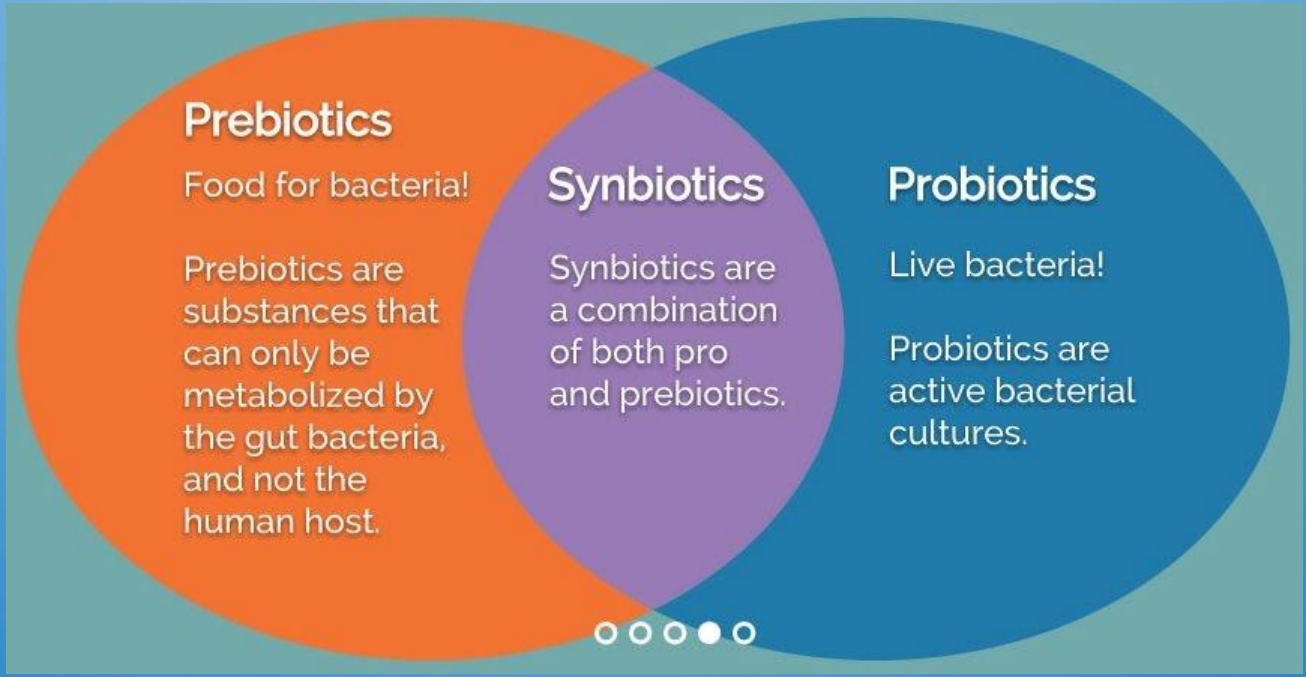
FORUMLA DIETS, THE WAY TO MIMIC BREAT MILK





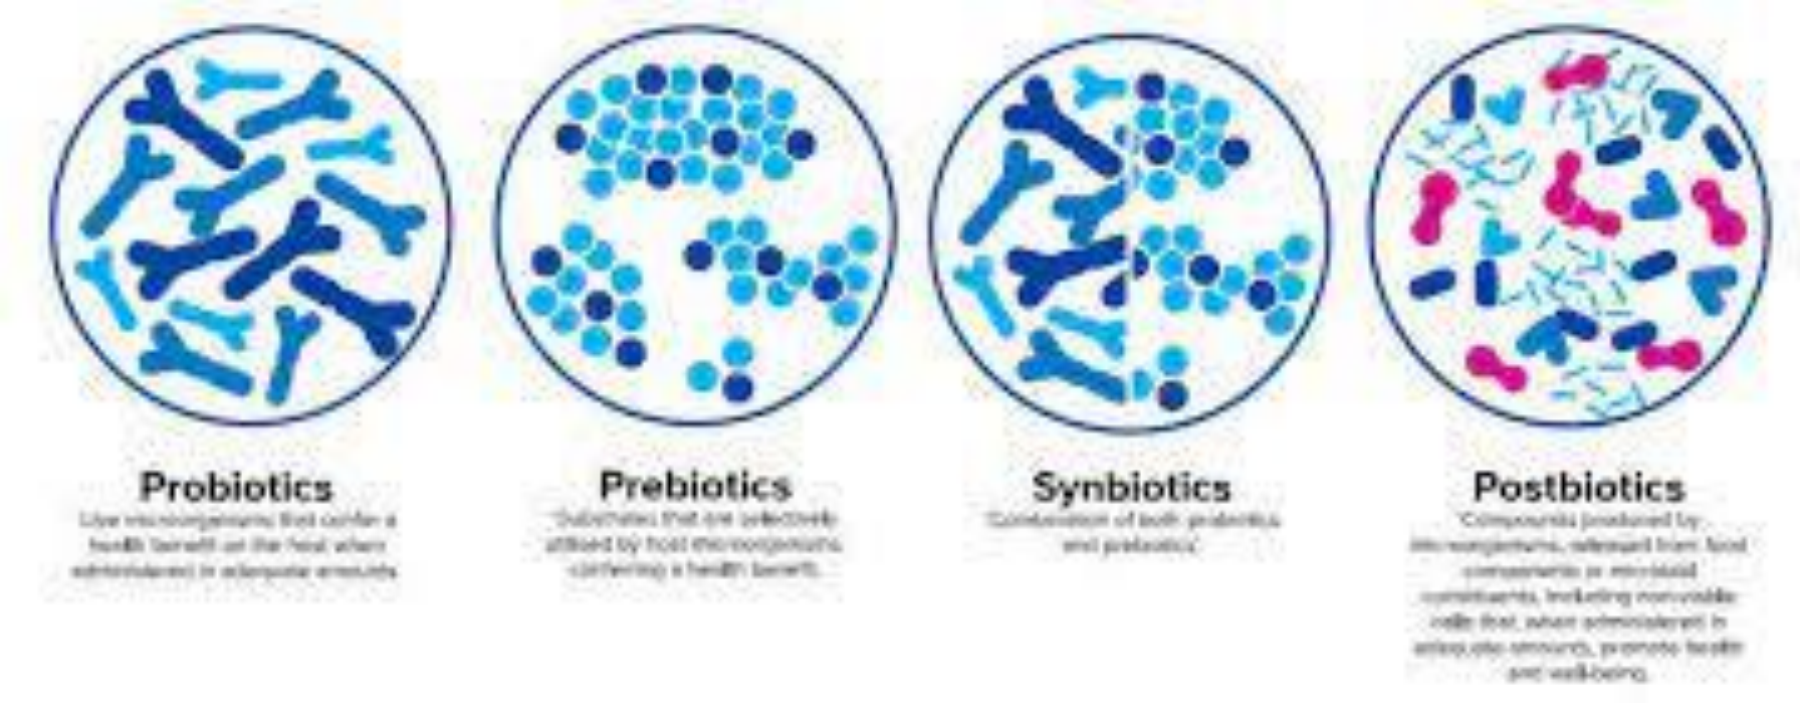


SYNBIOTICS



Prebiotics
Food for bacteria!
Prebiotics are substances that can only be metabolized by the gut bacteria, and not the human host.
Synbiotics
Synbiotics are a combination of both pro and prebiotics.
Probiotics
Live bacteria!
Probiotics are active bacterial cultures.

POSTBIOTICS



POSTBIOTICS

- **Bacteriocins** *(protective compounds that make life hard for the bad guys)**
- **Enzymes** *(help to digest food, get rid of toxins and assist other metabolic processes)**
- **Vitamins** *(like the B's and vitamin K)**
- **Amino acids** *(building blocks of protein)**
- **Neurotransmitters** *(carry messages between the nerves and brain and can even affect appetite)**
- **Immune-signaling compounds** *(they support the body's immune cells)**
- **Short-chain fatty acids** *(created from fiber, they keep the intestinal lining strong and healthy)**
- **Nitric oxide** *(crucial for cardiovascular health)**
- **Organic acids** *(such as Fulvic and Humic acid. They combine with minerals, making them easier to absorb and help maintain the correct pH in the GI tract)**

ABSTRACT

Two major forces have contributed to the fast growth of human genetic data. One from medical research supported by governments and academic institutes; the other from direct-to-consumer (DTC) sequencing companies. While the former benefits from meticulously designed sequencing standards and quality control procedures, the latter comes in various formats and sequencing methods which are subject to changes over time and the particular needs of different companies. Thanks to the general public who shared their DNA data without constraint, here we provide a review for over 7000 genomes made public between 2011 and 2020, and produced by over six DTC sequencing companies. An open source tool-kit to systematically parse, quality check and filter genome files and statistically problematic alleles is provided to prepare consumer DNA datasets for research. The *GenomePrep* output is available in two common DNA datafile formats to enable further analysis with other tools. We also provide for download the combined output for all OpenSNP array genomes processed in this paper in a single data freeze file.

For diseases controlled by 1000 loci of mean relative risk of only 1.04, a case-control study with 10,000 cases and controls can lead to selection of ~75 loci that explain >50% of the genetic variance. The 5% of people with the highest predicted risk are three to seven times more likely to suffer the disease than the population average, depending on heritability and disease prevalence. Whether an individual with known genetic risk develops the disease depends on known and unknown environmental factors.

But:
FTO+MC4R : 1.7 % increase in fat mass

J Mol Med (Berl). 2009 May; 87(5): 537–46. doi: 10.1007/s00109-009-0451-0. Epub 2009 Mar 3.

Combined effects of MC4R and FTO common genetic variants on obesity in European general populations.

Cauchi S[1], Stutzmann F, Cavalcanti-Proença C, Durand E, Pouta A, Hartikainen AL, Marre M, Vol S, Tammelin T, Laitinen J, Gonzalez-Izquierdo A, Blakemore AI, Elliott P, Meyre D, Balkau B, Järvelin MR, Froguel P.

Author information

Abstract

Genome-wide association scans recently identified common polymorphisms, in intron 1 of FTO and 188 kb downstream MC4R, that modulate body mass index (BMI) and associate with increased risk of obesity. Although their individual contribution to obesity phenotype is modest, their combined effects and their interactions with environmental factors remained to be evaluated in large general populations from birth to adulthood. In the present study, we analyzed independent and combined effects of the FTO rs1421085 and MC4R rs17782313 risk alleles on BMI, fat mass, prevalence and incidence of obesity and subsequent type 2 diabetes (T2D) as well as their interactions with physical activity levels and gender in two European prospective population-based cohorts of 4,762 Finnish adolescents (NFBC 1966) and 3,167 French adults (D.E.S.I.R.). Compared to participants carrying neither FTC nor MC4R risk allele (20-24% of the populations), subjects with three or four risk alleles (7-10% of the populations) had a 3-fold increased susceptibility of developing obesity during childhood. In adults, their combined effects were more modest (approximately 1.8-fold increased risk) and associated with a 1.27% increase in fat mass (P = 0.001). Prospectively, we demonstrated that each FTO and MC4R risk allele increased obesity and T2D incidences by 24% (P = 0.02) and 21% (P = 0.02), respectively. However, the effect on T2D disappeared after adjustment for BMI. The Z-BMI and ponderal index of newborns homozygous for the rs1421085 C allele were 0.1 units (P = 0.02) and 0.27 g/cm(3) (P = 0.005) higher, respectively, than in those without FTO risk allele. The MC4R rs17782313 C allele was more associated with obesity and fat mass deposition in males than in females (P = 0.003 and P = 0.03, respectively) and low physical activity accentuated the effect of the FTO polymorphism on BMI increase and obesity prevalence (P = 0.008 and P = 0.01, respectively). In European general populations, the combined effects of common polymorphisms in FTO and MC4R are therefore additive, predictive of obesity and T2D, and may be influenced by interactions with physical activity levels and gender, respectively.

Science. 2007 May 11;316(5826):889-94. Epub 2007 Apr 12.

A common variant in the FTO gene is associated with body mass index and predisposes to childhood and adult obesity.

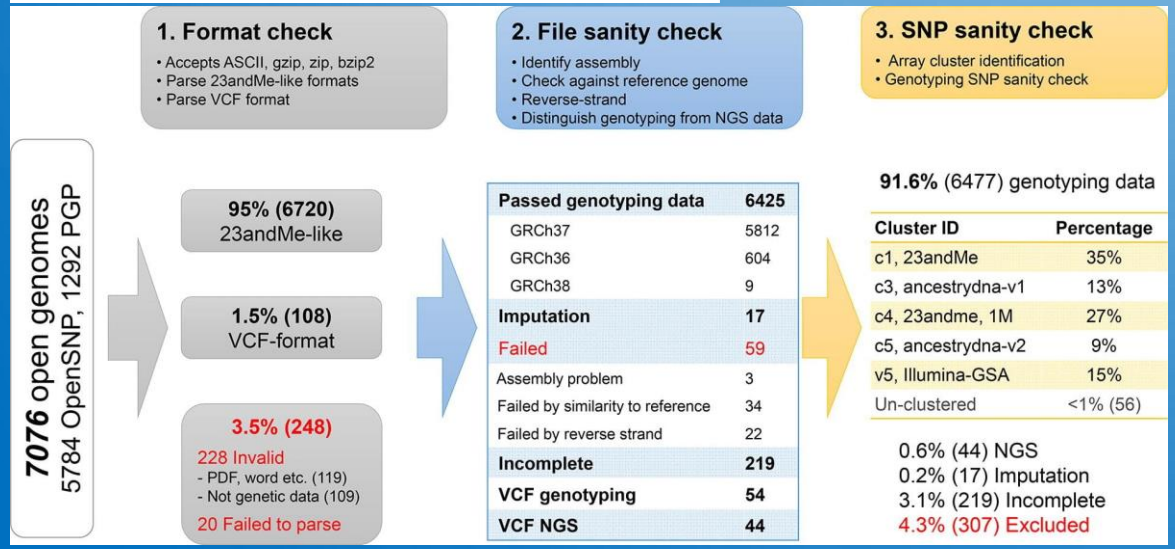
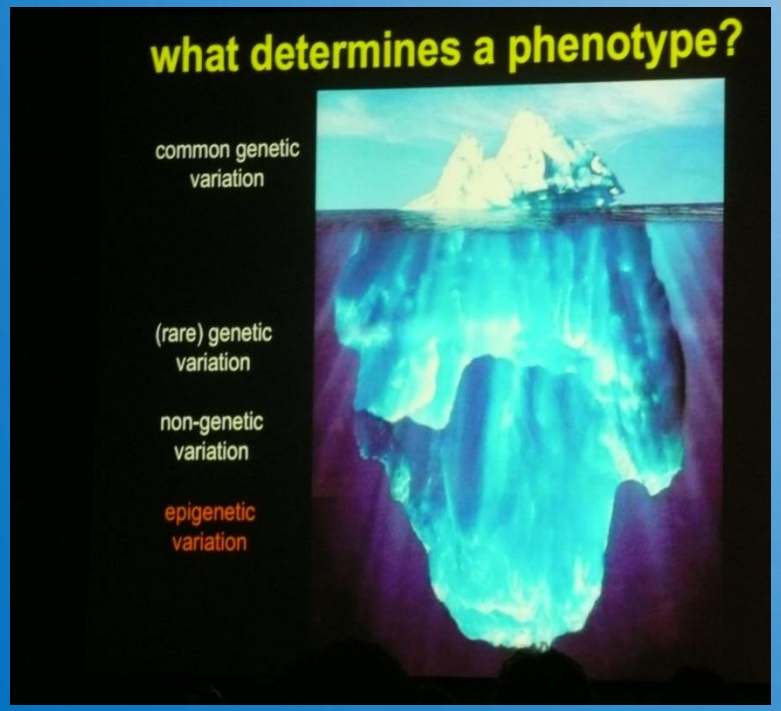
Author information

Abstract

Obesity is a serious international health problem that increases the risk of several common diseases. The genetic factors predisposing to obesity are poorly understood. A genome-wide search for type 2 diabetes-susceptibility genes identified a common variant in the FTO (fat mass and obesity associated) gene that predisposes to diabetes through an effect on body mass index (BMI). An additive association of the variant with BMI was replicated in 13 cohorts with 38,759 participants. The 16% of adults who are homozygous for the risk allele weighed about 3 kilograms more and had 1.67-fold increased odds of obesity when compared with those not inheriting a risk allele. This association was observed from age 7 years upward and reflects a specific increase in fat mass.



MISSING HERITABILITY: WHAT IS MISSING TO UNDERSTAND A PHENOTYPE: GENE- ENVIRONMENT INTERACTIONS, EPIGENETICS, REVERSIBILITY



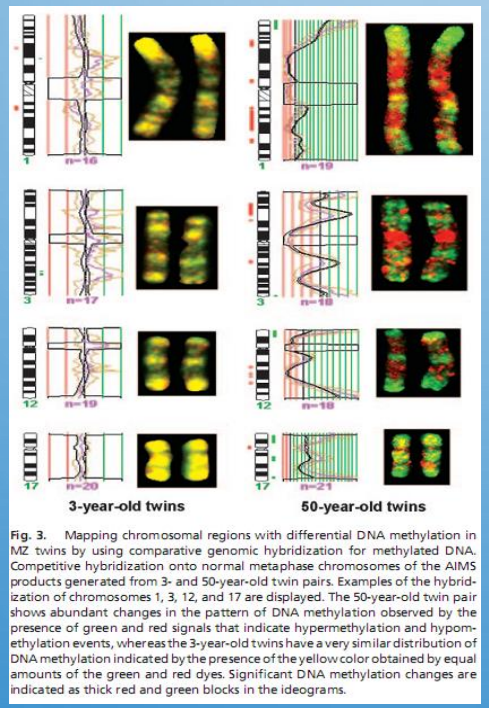


Fig. 3. Mapping chromosomal regions with differential DNA methylation in MZ twins by using comparative genomic hybridization for methylated DNA. Competitive hybridization onto normal metaphase chromosomes of the AIMS products generated from 3- and 50-year-old twin pairs. Examples of the hybridization of chromosomes 1, 3, 12, and 17 are displayed. The 50-year-old twin pair shows abundant changes in the pattern of DNA methylation observed by the presence of green and red signals that indicate hypermethylation and hypomethylation events, whereas the 3-year-old twins have a very similar distribution of DNA methylation indicated by the presence of the yellow color obtained by equal amounts of the green and red dyes. Significant DNA methylation changes are indicated as thick red and green blocks in the ideograms.

CONEQUENCES FOR INTERVENTION: FLAGSHIP EU-FOOD4ME STUDY RESULTS PROVE „PERSONAL NUTRITION DOES BETTER THAN ON SIZE FITS ALL“, J. MATHERS

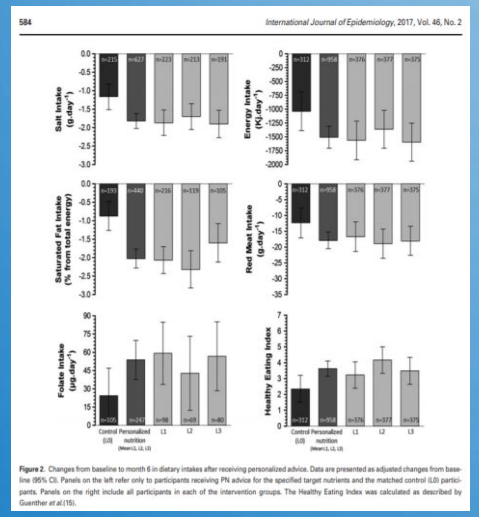

Figure 2. Changes from baseline to month 6 in dietary intakes after receiving personalized advice. Data are presented as adjusted changes from baseline (95% CI). Panels on the left refer only to participants receiving PN advice for the specified target nutrients and the matched control (L0) participants. Panels on the right include all participants in each of the intervention groups. The Healthy Eating Index was calculated as described by Guenther et al.(15).

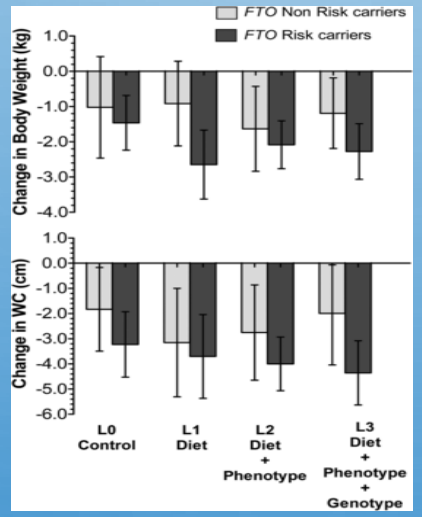

Changs of dietary intake after personalised advice Healthy eating index

Changes in adiposity markers were greater in participants who were informed that they carried the *FTO* risk allele (level 3 AT/AA carriers) than in the nonpersonalized group

AND WHAT HAPPENS TO OUR PYRAMIDE? BUT ALREADY THE DIETARY REFERENCE VALUES1992 US USDA-PYRAMIDE, USED AN INDIVIDUALISED APPROACH, AGE, LIFESTYLE (WORK)

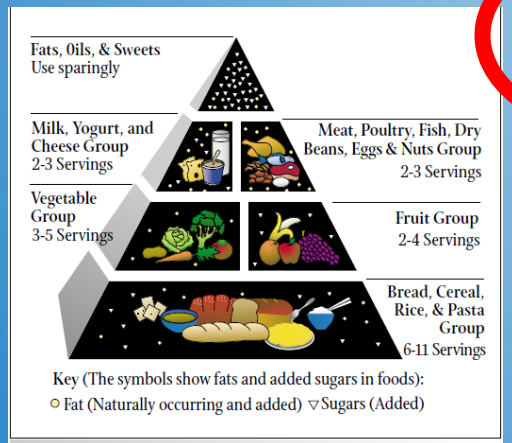

FIGURE 2
1992 FOOD PYRAMID

TABLE 1
MYPYRAMID FOOD PLAN FOR A 38-YEAR-OLD MALE WHO EXERCISES AN AVERAGE OF 30-60 MINUTES PER DAY.

Food group	Recommendation (per day)
Grains	9 oz. (half should be whole grains)
Vegetables	3.5 cups
Fruits	2 cups
Milk	3 cups
Meat and beans	6.5 oz.
Oil	8 tsp.
Discretionary	410 calories (extra fats and sugars)
Total daily calories	2,600

TABLE 2
SAMPLE MENU THAT MEETS THE MYPYRAMID RECOMMENDATIONS FOR HEALTHY EATING FOR A 38-YEAR-OLD MALE WHO EXERCISES AN AVERAGE OF 30-60 MINUTES PER DAY.*

Breakfast Bagel with fruit other than raisins, 1 large (3.5" to 3.75" diameter) Orange juice, 1.5 cup
Snack Black beans, cooked, no fat added, 1 cup Rice, brown, medium-grain, cooked, .5 cup Bread, multigrain, toasted, 2 large slices
Lunch McDonald's garden salad French fries, from frozen, deep-fried, 1 small fast-food order Milk, 1%, 1 cup

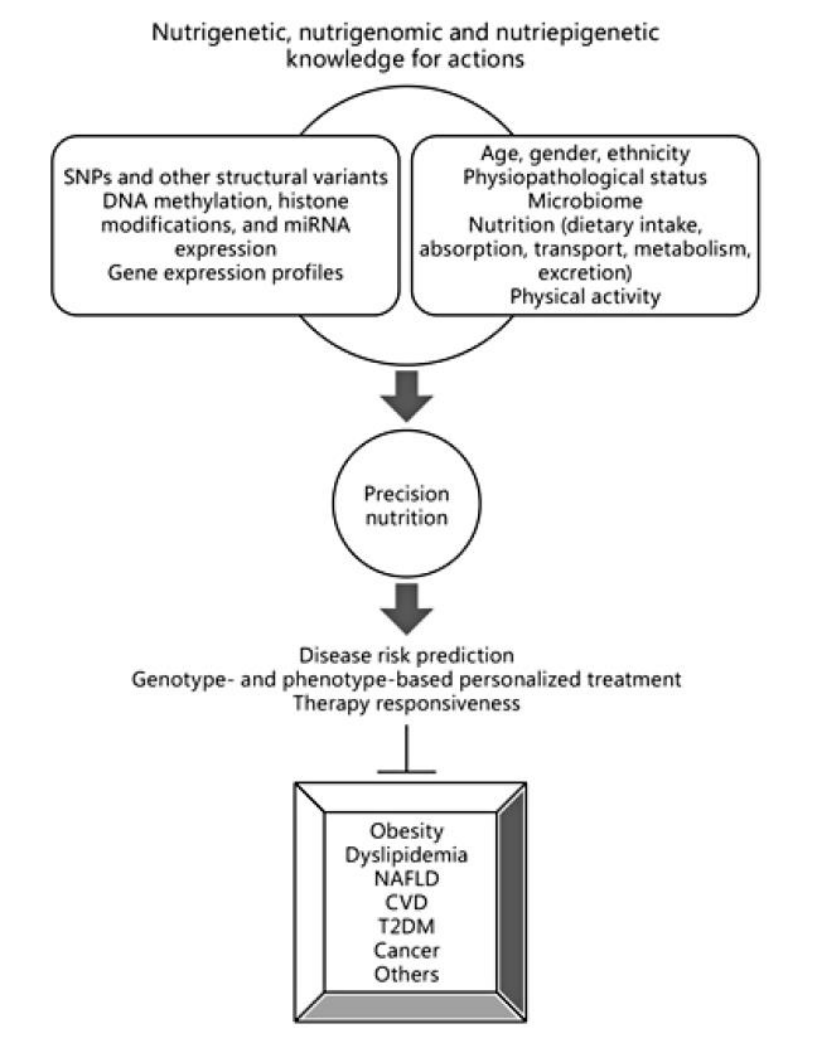
PRECISION-, PERSONALISED NUTRITION, THE WAY WE MAY GO



Mobile apps and wearable devices facilitate real-time assessment of dietary intake and provide feedback which can improve glycaemic control and diabetes management.

By integrating these technologies with big data analytics, precision nutrition has the potential to provide personalised nutrition guidance for more effective prevention and management of complex metabolic diseases

(D. D. Wang & Hu, 2018).

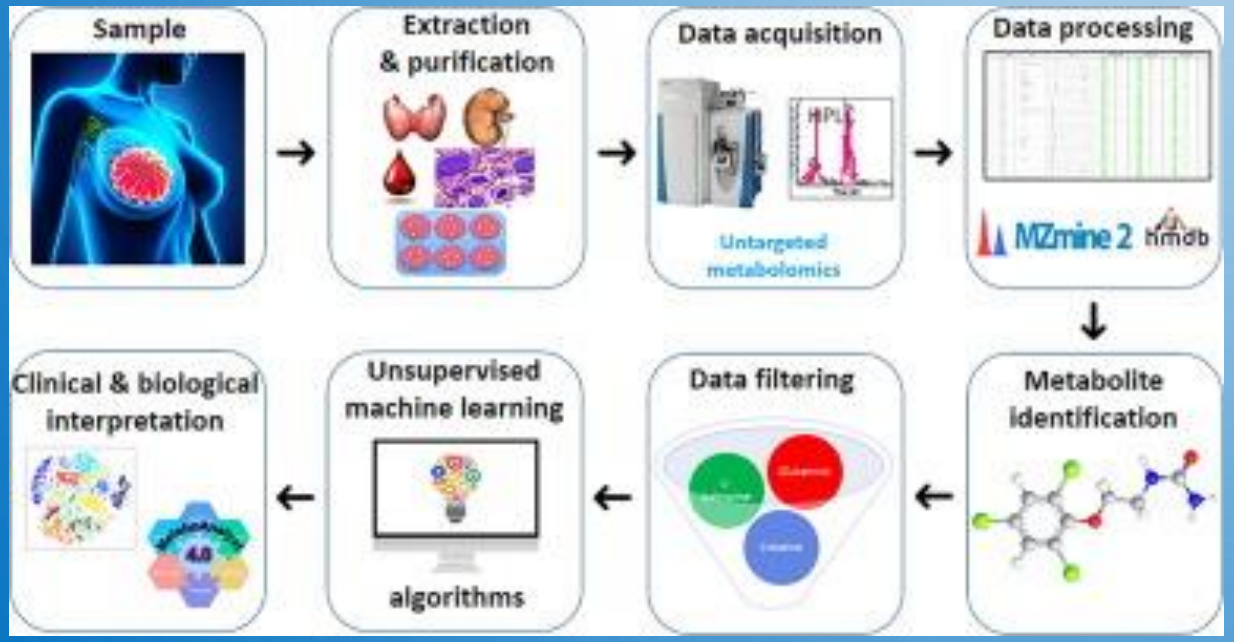
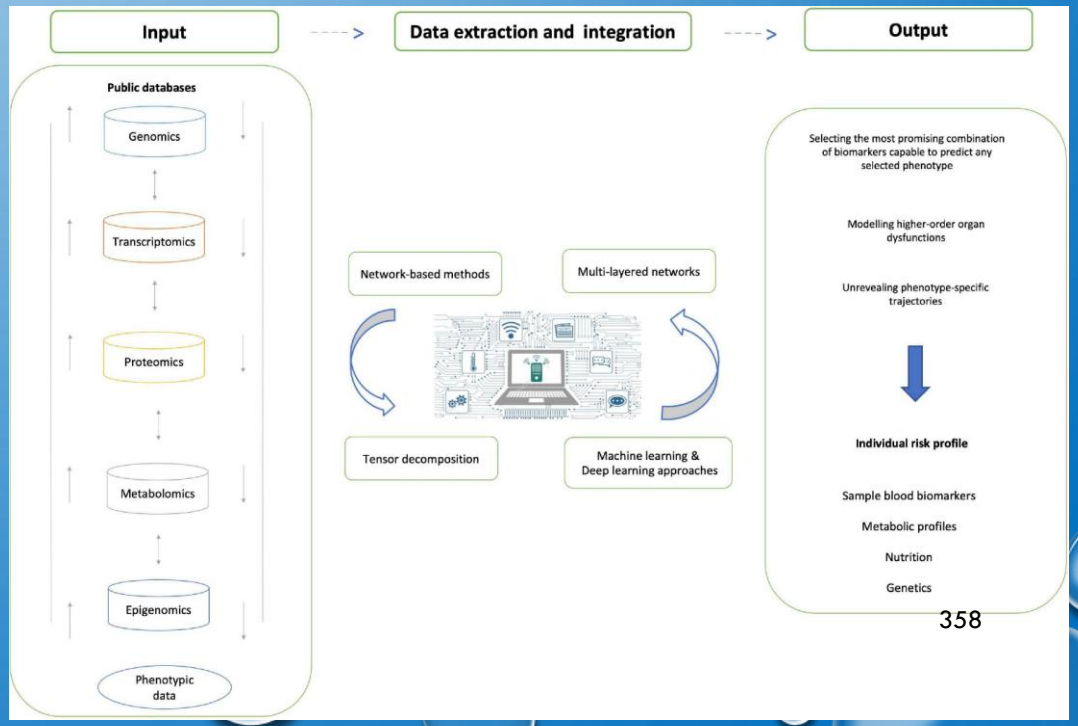
Definition of aging and non-aging systems in reliability theory

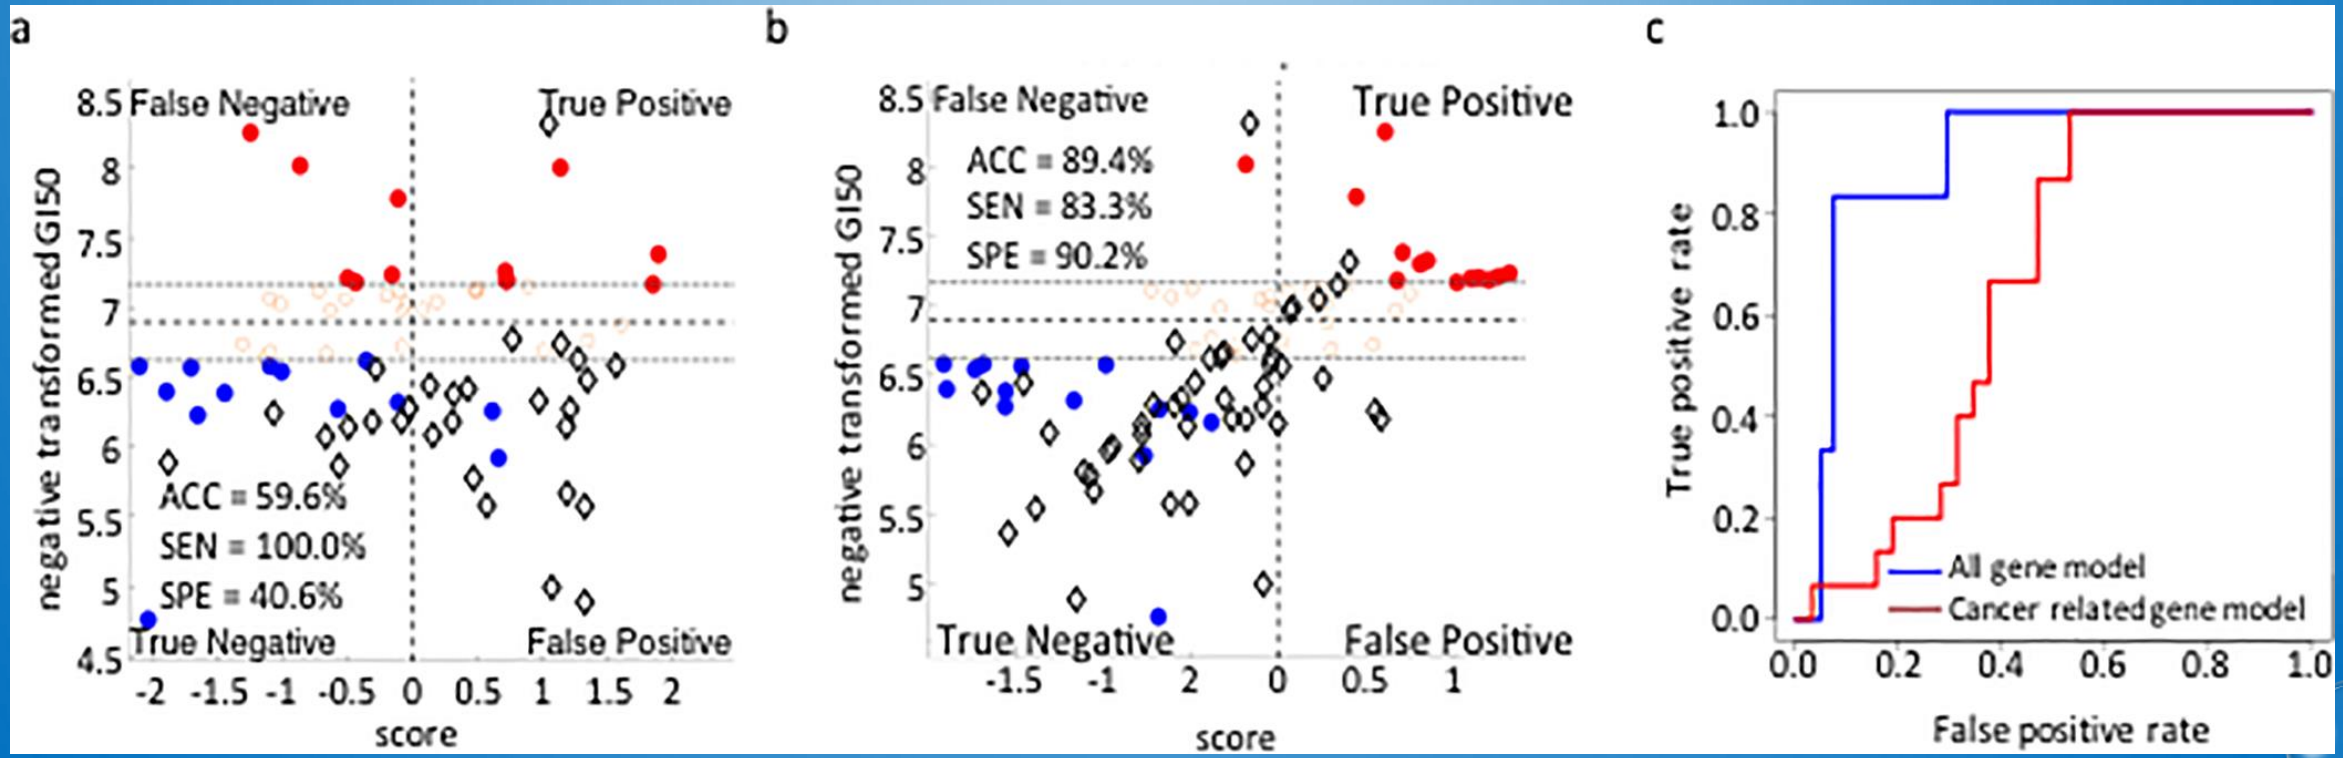
- **Aging: increasing risk of failure with the passage of time (age).**
- **No aging: 'old is as good as new' (risk of failure is not increasing with age)**
- **Increase in the calendar age of a system is irrelevant.**

DATA PROCESSING INTERATION

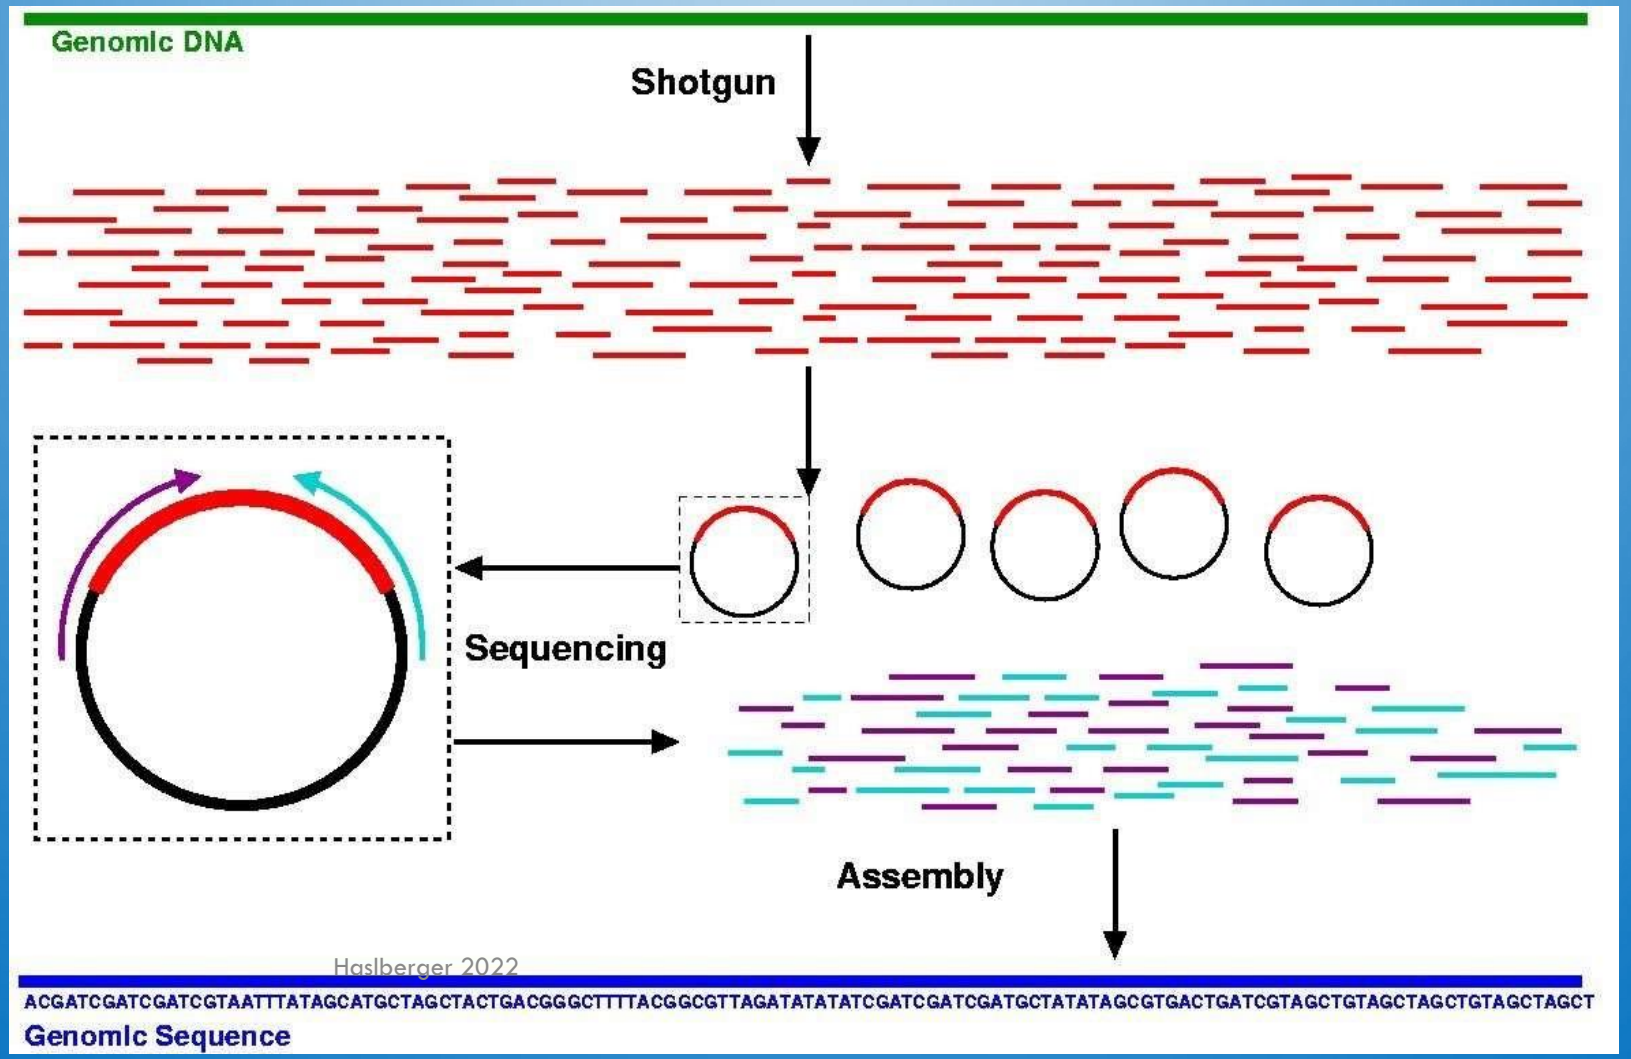




SELF LEARNING ALGORITHMS



SHOTGUN METHOD



SANGER METHOD

Sanger sequencing

- Low-throughput, but accurate and can handle up to 1000bp
- Still standard for small-scale laboratory use

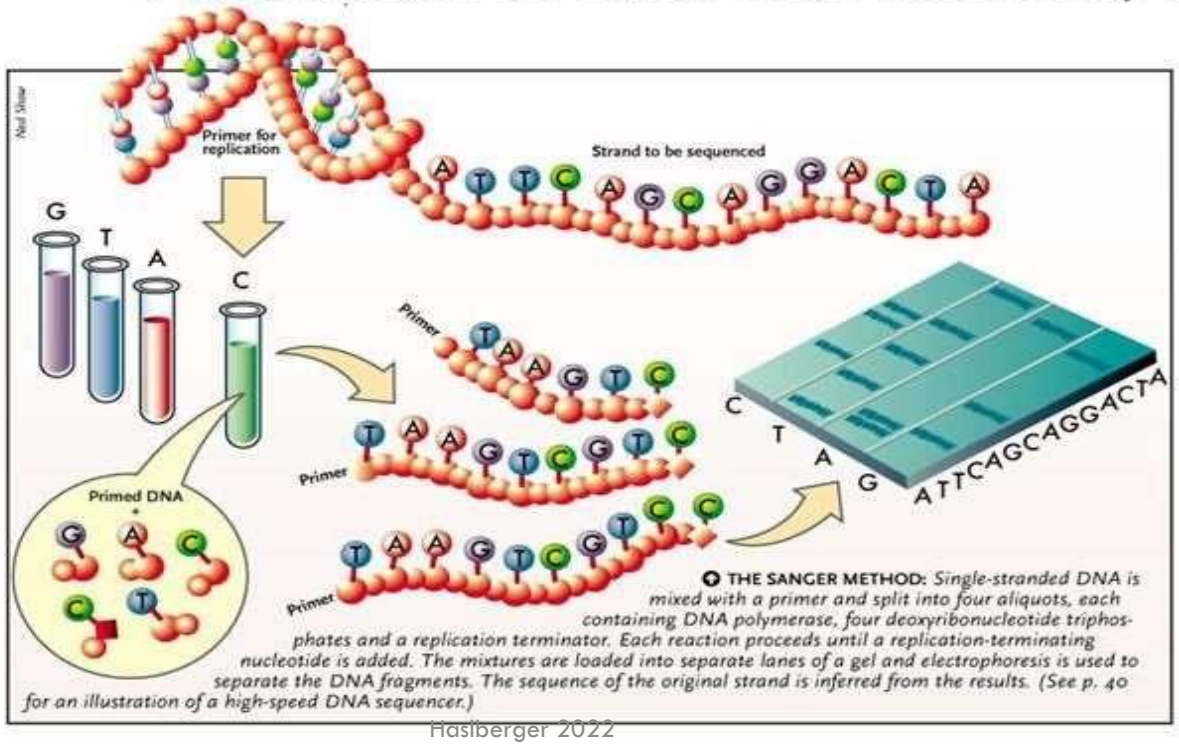


Image credit: the-scientist.com

Components:

- DNA to be sequenced
- Primer
- Free nucleotides that allow further extension (dNTP, circles):
  - N=A, C, G or T, all four types are present
- Free nucleotides that terminate extension (ddNTP, rhombuses):
  - N=A, C, G or T, only one type is present
- DNA polymerase
